**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **1. Introduction**

2 **Q. What is your name, position and business address?**

3 A. My name is David A. Schlissel. I am a Senior Consultant at Synapse Energy  
4 Economics, Inc, 22 Pearl Street, Cambridge, MA 02139.

5 **Q. On whose behalf are you testifying in this case?**

6 A. I am testifying on behalf of Fresh Energy, Izaak Walton League of America –  
7 Midwest Office, Wind on the Wires, Union of Concerned Scientists, and  
8 Minnesota Center for Environmental Advocacy (“Joint Intervenors”).

9 **Q. Have you testified previously in this Proceeding?**

10 A. Yes. I filed testimony in this proceeding on November 17 and November 29,  
11 2006.

12 **Q. Have you included a current copy of your resume as an exhibit?**

13 A. Yes. A current copy of my resume is included as Exhibit JI-35-A.

14 **Q. What is the purpose of your supplemental testimony?**

15 A. Synapse was retained by the Joint Intervenors to evaluate the supplemental  
16 testimony and analyses filed by the remaining Big Stone II Project Co-owners  
17 (“Applicants”) in mid-November following the withdrawal of GRE and SMMPA  
18 from the Project. This testimony presents the results of our assessments of the  
19 Applicants’ new testimony and analyses.

20 **Q. Were there other members of the Synapse staff who also assisted in the**  
21 **analyses undertaken by Synapse as part of its evaluation of the Applicants’**  
22 **revised testimony and analyses?**

23 A. Yes. Dr. David White, Bruce Biewald, Michael Drunsic, Richard Hornby, Robin  
24 Maslowski, and Robert Fagan also were members of the Synapse team for this

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 project. Former Synapse staff member Anna Sommer also assisted me in the  
2 preparation of this testimony. Copies of their resumes are available at  
3 www.synapse-energy.com. Michael Drunsic and Robert Fagan also are filing  
4 supplemental testimony at this time.

5 **Q. Please summarize your conclusions.**

6 A. My conclusions are as follows:

- 7 1. Construction of the proposed Big Stone II Project would be incompatible  
8 with the State of Minnesota's new requirements that greenhouse gas  
9 emissions be reduced below 2005 levels by 15 percent by 2015, by 30  
10 percent by 2025 and by 80 percent by 2050.
- 11 2. Increasing numbers of proposed coal-fired power plants have been  
12 cancelled, delayed and rejected by state regulatory commissions or boards  
13 within the past year because of, or at least in large part due to, the  
14 uncertainties and risks regarding future carbon regulations and  
15 construction costs.
- 16 3. Developments in the twelve months since I last testified in this proceeding  
17 confirm the conclusion in my November 2006 testimony that the potential  
18 for future federal restrictions on CO<sub>2</sub> emissions and the potential for  
19 further increases in construction costs are very significant uncertainties  
20 and risks for the Big Stone II Project. However, the Applicants have not  
21 adequately considered these uncertainties and risks in the new testimony  
22 and analyses that they have submitted since GRE and SMMPA withdrew  
23 from the Project.
- 24 4. It is particularly important for the Applicants to examine their involvement  
25 in the Big Stone II Project in light of coming federal regulation of  
26 greenhouse gas emissions. It would be imprudent for the Applicants to  
27 continue their participation in the Project without fully considering the risk

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 of significantly higher CO<sub>2</sub> prices in its resource planning process. Instead  
2 of simply considering one very low CO<sub>2</sub> price in their analyses, the  
3 Applicants should use a broad range of possible CO<sub>2</sub> prices, such as the  
4 Synapse Low, Mid and High forecasts in order to more reasonably reflect  
5 uncertainty and risk.

6 5. Soaring power plant construction costs also will have a significant impact  
7 on the results of properly performed resource planning. Actual and  
8 estimated power plant capital costs have been strongly affected by the  
9 domestic and international competition for design and construction  
10 resources, manufacturing capacity and commodities. It would be  
11 imprudent to not allow for the possibility that these same factors which  
12 have led to the skyrocketing of power plant construction costs in recent  
13 years will continue to significantly affect project costs during the design  
14 and construction of the proposed Big Stone II Project. However, the  
15 Applicants have not prepared any scenarios or analyses that consider  
16 further increases in the cost of building the Big Stone II Project.

17 6. In their supplemental testimony and analyses, the Applicants still have not  
18 shown that their demand for electricity cannot be met more cost  
19 effectively through energy conservation and load-management measures  
20 than through the Big Stone II Project.

21 7. In their supplemental testimony and analyses, the Applicants still have not  
22 shown that the Big Stone II Project would be a lower cost option than  
23 renewable energy resources

24 For these reasons, my recommendation remains that the Commission should  
25 reject the Applicants' request for a Certificate of Need for the proposed Big Stone  
26 II Project.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. Please explain how you conducted your new investigations of the Applicants**  
2 **supplemental testimony and analyses in this proceeding.**

3 A. We have reviewed the testimony and exhibits filed by the Applicants on  
4 November 13, 2007. Joint Intervenors also have submitted 78 information  
5 requests to the Applicants, some of which have been answered. In addition, we  
6 have reviewed the Applicants' responses to the discovery submitted by the  
7 Department of Commerce ("DOC"). We also have participated in several  
8 telephone conversations in which the Applicants graciously answered our  
9 questions. Finally, we have analyzed the modeling results presented by Otter Tail  
10 Power, MDU, CMMPA and MRES and have rerun the Strategist model for MDU,  
11 CMMPA and MRES.

12 **Q. Does this testimony discuss MRES' new modeling analyses?**

13 A. No. We are in the process of redoing our analysis of MRES because Mr.  
14 Schumacher has filed new Supplemental Testimony that corrected some of  
15 MRES' modeling data.

16 **Q. Have you reviewed Heartland's new economic analyses?**

17 A. No. Due to the expedited schedule in this proceeding we have not had time to  
18 evaluate Heartland's new economic analyses. Instead, we have focused on Otter  
19 Tail Power, MRES, CMMPA, and to a lesser extent, MDU.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **2. Construction of the Big Stone II Project would be Incompatible with**  
2 **the State of Minnesota’s Legislated Requirements for Reducing**  
3 **Greenhouse Gas Emissions**

4 **Q. What action has the Minnesota Legislature taken regarding future emissions**  
5 **of greenhouse gases?**

6 A. In 2007, the Minnesota legislature adopted the Next Generation Energy Act of  
7 2007, which among other things established state goals for deep greenhouse gas  
8 emission reductions for the state.<sup>1</sup> The state’s goal is to reduce its greenhouse gas  
9 emissions by 15% by the year 2015, by 30% by 2025, and by 80% by 2050 (all  
10 below 2005 levels). The statute defines greenhouse gas emissions to include  
11 those associated with imported electricity, and would therefore count emissions  
12 associated with the Minnesota share of power generated at Big Stone II. A  
13 stakeholder process was established under the law and tasked with developing a  
14 plan to achieve these reduction goals, to be delivered to the legislature by  
15 February 1, 2008.

16 **Q. Will construction and operation of the Big Stone II Project result in the**  
17 **reductions in CO<sub>2</sub> emissions required under the new Minnesota legislation?**

18 A. No. The Big Stone II Project will emit between 3.7 and 4.3 million tons of CO<sub>2</sub>  
19 each year. This will result in increases, not decreases, in future CO<sub>2</sub> emissions. As  
20 a result, adding Big Stone II would be a step in the wrong direction and would be  
21 incompatible with the State of Minnesota’s legislation requirements for future  
22 reductions in greenhouse gas emissions.

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. Is it reasonable to expect that the Big Stone II Project will result in the**  
2 **backing down or retirement of existing coal-fired power plants?**

3 A. Not to a significant extent. The Applicants have claimed that the Big Stone II  
4 Project is needed to serve growing loads and to fill regional baseload needs.<sup>2</sup> That  
5 argument is inconsistent with any claim that construction of the Big Stone II  
6 Project will allow the retirement or backing down of existing coal-fired power  
7 plants.

8 **Q. Do you have any comments about Applicant witness Uggerud’s discussion of**  
9 **regional capacity needs?**<sup>3</sup>

10 A. Yes. I have a number of comments about Mr. Uggerud’s discussion of regional  
11 capacity needs.

12 First, I agree that serious actions need to be taken by the load serving entities,  
13 generators, state governments and the Midwest Reliability Organization (“MRO”)  
14 to address possible capacity deficits. However, those actions need to be  
15 consistent with regional and state efforts to reduce CO<sub>2</sub> emissions and to increase  
16 the region’s dependence on renewable resources. Building the Big Stone II  
17 Project, which would emit approximately 3.8 to 4.3 million tons of CO<sub>2</sub> each  
18 year, would be a major step in the wrong direction at this time. The Commission  
19 should not be panicked into approving an uneconomic coal-fired power plant by  
20 the threat of a “looming generation capacity deficit” as suggested by Mr.  
21 Uggerud.<sup>4</sup>

22 Instead, the Commission should require that the Applicants adopt policies and  
23 alternatives that provide needed energy at the lowest cost, subject to  
24 considerations of risk. As I will explain, the Applicants have not shown that

---

<sup>2</sup> For example, see Applicants’ Exhibit 114, at pages 2 through 4.

<sup>3</sup> Applicants’ Exhibit 114, at pages 2-4.

<sup>4</sup> Id., at page 3, lines 11-14.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 building a new multi-billion dollar coal plant is a less expensive and lower risk  
2 option than expanding efforts on renewable resources and energy efficiency and,  
3 where necessary, adding some efficient new gas-fired combined cycle and  
4 peaking capacity. This is especially true given the significant cost uncertainties  
5 surrounding regulation of greenhouse gas emissions and the ultimate cost and  
6 completion date of the Big Stone II Project.

7 Second, the North American Electric Reliability Corporation (“NERC”)  
8 assessment cited by Mr. Uggerud only shows that additional capacity is needed  
9 during the peak summer hours. It does not show whether that additional capacity  
10 should be peaking capacity, intermediate capacity or baseload capacity. The  
11 Applicants’ flawed and biased new modeling analyses are the only evidence that  
12 has been presented to show that adding new baseload generating capacity is the  
13 most economic option.

14 Third, there is no evidence that the capacity and load information in the NERC  
15 Long-Term Assessment relied upon by Mr. Uggerud reflects any of the many  
16 changes that are occurring in the region regarding energy usage and the types of  
17 capacity that will be needed. These changes include the new Minnesota statute  
18 establishing a statewide goal of achieving annual savings of 1.5 percent of retail  
19 energy sales of electricity and natural gas,<sup>5</sup> the new Minnesota Renewable Energy  
20 Objective Statute,<sup>6</sup> efforts in other states to reduce energy and capacity demands  
21 and to increase the amounts of electricity generated from renewable energy  
22 resources, actions at the federal level such as the recent adoption of new appliance  
23 standards as part of the new energy bill, developments in the MISO energy  
24 markets, and the development by MISO of rules allowing the participation of  
25 demand response resources in the ancillary services markets.

<sup>6</sup> Minn. Stat. Sec. 216B.1691.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 For example, when it announced its withdrawal from the Big Stone II Project in  
2 September 2007, Great River Energy cited the following as one of the reasons for  
3 its decision to leave the Project:

4 The cost of Big Stone II has increased due to inflation and project  
5 delays. Although the costs of alternative resources have also  
6 increased, Great River Energy now anticipates the energy markets  
7 through the Midwest Independent System Operator (MISO), will  
8 provide access to additional lower-cost alternatives than initially  
9 assumed.<sup>7</sup>

10 Another significant new development is the agreement by nine states in the  
11 region, working together through the Midwest Governors Association, to adopt  
12 the goal of meeting at least 2 percent of regional annual retail sales of electricity  
13 through energy efficiency improvements by 2015, with additional savings in  
14 subsequent years, and adopted regional renewable energy goals of 10% by 2015,  
15 20% by 2020, 25% by 2025, and 30% by 2030.<sup>8</sup> All of these changes will affect  
16 how much new capacity will be needed and what capacity will be the most  
17 economic to add.

18 Fourth, as Xcel Energy has explained in its recently filed 2007 Resource Plan,  
19 analyses are currently underway that may result in reduced regional reserve  
20 requirements:

21 We currently plan to obtain sufficient capacity to meet all of our  
22 projected needs plus a 15% MAPP reserve margin. In the past  
23 year, there has been much discussion and change among Midwest  
24 utilities with respect to reserve margins . . . MRO is in the process  
25 of developing new resource adequacy standards for our region that  
26 will likely go into effect toward the end of 2008. . . early  
27 indications are that the reserve margin resulting from this [LOLE]  
28 study will be lower than the 15% reserve margin currently

---

[http://www.greatriverenergy.com/press/news/091707\\_big\\_stone\\_ii.html](http://www.greatriverenergy.com/press/news/091707_big_stone_ii.html)

<sup>8</sup> Midwest Governors Association, "Energy Security and Climate Stewardship Platform for the Midwest, 2007," Nov. 15, 2007. The Platform was agreed to by Indiana, Illinois, Iowa, Kansas, Michigan, Minnesota, Ohio, South Dakota, Wisconsin and the province of Manitoba.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 required. However, the MDC ratings of units are also lower than  
2 our URGE ratings . . . we expect an overall reduction in our  
3 planning reserve requirement but do not yet have enough  
4 information to calculate an estimate. In order to evaluate the  
5 impact of changing reserve margins on our future resource  
6 requirements, we evaluated our Resource Plan using reserve  
7 margins of 12% and 15% based on our median (50/50) peak  
8 forecast and our unit MDCs.<sup>9</sup>

9 **Q. Is it possible that adding new baseload generating capacity could be the more**  
10 **economic option even if the capacity is not needed for system reliability or if**  
11 **there is only a need for peaking capacity?**

12 A. Yes. It is possible that the addition of a new baseload generating facility can be  
13 the lowest cost option even if all of the capacity from that facility is not  
14 immediately needed to ensure that an adequate level of system reliability.  
15 However, as I will explain later in this testimony, the new modeling analyses  
16 presented by the Applicants are flawed and biased in favor of the Big Stone II  
17 Project and, therefore, do not represent credible evidence that the Project is the  
18 lowest cost option available to the Applicants.

19 **Q. Is it even certain that the Big Stone II Project will be in service by 2013?**

20 A. No. Completion of the Project in 2013 is not guaranteed. The recent experience  
21 of numerous other coal-fired power plant construction projects suggests that the  
22 completion of the Big Stone II Project will occur later and cost far more than the  
23 Applicants now admit.

<sup>9</sup> Northern States Power Company, *2007 Resource Plan*, Docket No. E002/RP-07 \_\_\_, December 14, 2007, at pages 4-4 and 4-5.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. Mr. Uggerud expresses concern about relying “solely on natural gas,**  
2 **conservation or renewable energy instead” and “over-reliance on natural**  
3 **gas.”<sup>10</sup> Are you recommending that the Applicants rely “solely” on natural**  
4 **gas, conservation or renewable energy?**

5 A. No. I am recommending that the Applicants investigate and implement portfolios  
6 of alternatives to the Big Stone II Project that would include energy efficiency,  
7 more renewable resources, and, to the most limited extent necessary, the addition  
8 of new natural gas-fired capacity. In fact, regardless of what happens with the  
9 Big Stone II Project, the Applicants still will maintain their existing coal-fired  
10 facilities. So we are not recommending that any of them rely “solely’ on natural  
11 gas, conservation or renewable energy.

12 **Q. Do you agree with Mr. Uggerud that over-reliance on natural gas is a**  
13 **concern?**

14 A. In general, I do agree that over-reliance on natural gas can be a concern.  
15 However, in this specific instance and in this specific area of the nation, it does  
16 not appear that the MRO would be overly reliant on natural gas if the Commission  
17 rejected the Applicants request to build the Big Stone II Project.

18 Figures 1 and 2 below are taken from the same NERC *2007 Long-Term*  
19 *Assessment Reliability Assessment 2007-2016*. These Figures show that in 2006,  
20 the region’s generating capacity was 55 percent coal-fired and only 12 percent  
21 gas-fired (24 percent if gas-fired capacity and dual fuel capacity are considered  
22 together). It further shows that in 2012, the region’s generating capacity will still  
23 be 55 percent coal-fired and only 13 percent gas-fired (still 24 percent if gas-fired  
24 and dual fuel are considered). The replacement of the Big Stone II Project, in part,  
25 by natural gas-fired capacity will not significantly change these figures. Thus,  
26 there is no real danger of over-reliance on natural gas in the upper Midwest.

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **3. The Applicants Have Not Adequately Considered The Risks**  
2 **Associated With Building A New Coal-Fired Generating Unit**

3 **Q. Last year you testified that the Applicants had failed to adequately consider**  
4 **the risks associated with evaluating the economics of building the proposed**  
5 **Big Stone II Project. Is that still your conclusion after reviewing the**  
6 **supplemental testimony and analyses prepared by the Applicants this past**  
7 **fall after GRE and SMMPA withdrew from the Project?**

8 **A. Yes.**

9 **Q. You testified in Joint Intervenors Exhibit 3 that the potential for future**  
10 **restrictions on CO<sub>2</sub> emissions and the potential for large increases in the**  
11 **project's capital cost were the most significant uncertainties and risks facing**  
12 **the Big Stone II Project. Do these remain the most significant uncertainties**  
13 **and risks for the Project?**

14 **A. Yes.** Developments over the past twelve months since I presented my November  
15 29, 2006 testimony in this proceeding confirm and re-emphasize that the potential  
16 for future restrictions on CO<sub>2</sub> emissions and the potential for large increases in  
17 capital costs are very significant uncertainties and risks associated with building  
18 and operating new coal-fired generating plants like the proposed the Big Stone II  
19 Project.

20 I also want to note that there also are other potential uncertainties and risks for  
21 new coal plants. These other uncertainties and risks include the potential for  
22 higher fuel prices, fuel supply disruptions that could affect plant operating  
23 performance; the potential for increasing stringency of regulations of current  
24 criteria pollutants; and the potential for expanded state and/or federal energy  
25 efficiency and renewable energy requirements.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. What consideration have the Applicants given in their supplemental**  
2 **testimony to the risks associated with restrictions on future CO<sub>2</sub> emissions**  
3 **and capital cost increases?**

4 A. The Applicants have only given very limited consideration to the risks associated  
5 with future CO<sub>2</sub> emissions and further Project construction cost increases and  
6 delays. For example, Otter Tail Power, MRES and CMMPA did assume a CO<sub>2</sub>  
7 price in their new modeling analyses. However, they each assumed that CO<sub>2</sub>  
8 prices would not exceed \$9/ton, in nominal terms. As before, MDU did not  
9 assume any CO<sub>2</sub> prices in its new analyses (that is, MDU assumed that CO<sub>2</sub>  
10 emissions have a zero price associated with them). None of the Applicants  
11 examined the impact of higher CO<sub>2</sub> prices on the relative economics of the Big  
12 Stone II Project .

13 Similarly, in their new analyses each Applicant used the October 2006 Big Stone  
14 II Project capital cost estimate, updated to reflect an additional year of delay,  
15 **[TRADE SECRET MATERIALS BEGINS TRADE SECRET**  
16 **MATERIALS END]** in unspecified savings, and scaling down to smaller plant  
17 sizes. However, none of the Applicants conducted any sensitivity studies to  
18 consider the impact of further increases in the cost of building the proposed  
19 Project. Nor did the Applicants conduct any sensitivity studies to consider the  
20 impact of additional schedule delays on the relative economics of Big Stone II  
21 against alternative plans that included wind and energy efficiency. In fact, there  
22 is no evidence that the Applicants even have asked Black & Veatch to update its  
23 2006 analysis of project costs and schedule.

24 **Q. Is this a reasonable approach?**

25 A. No. Higher CO<sub>2</sub> prices and increased Project construction costs or additional  
26 schedule delays, on their own or in combination, will impact the Project's  
27 economics relative to other alternatives and may make the proposed Big Stone II  
28 Project uneconomic for one or more of the Applicants. The important reason to

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 prepare sensitivities is to determine what changes in CO<sub>2</sub> prices and/or  
2 construction costs would make the Project uneconomic and then to evaluate how  
3 likely those changes are. Unfortunately, the Applicants did not prepare these  
4 critical analyses. Instead, they have assumed that the current plant construction  
5 cost estimate and a flat \$9/ton CO<sub>2</sub> price are the highest reasonable values. This  
6 is imprudent. Risk and uncertainty are inherent in all enterprises. They do not go  
7 away merely because they are ignored in economic analyses.

8 **Q. Have other companies provided sensitivity analyses for key input parameters**  
9 **in their Integrated Resource Plans or in the modeling analyses presented in**  
10 **support of requests to build and operate new generating facilities?**

11 A. Yes. We have seen such sensitivity analyses for key input parameters in many of  
12 the power plant cases in which we have been involved in recent years.

13 **Q. Have you seen any recent instances in which companies have decided not to**  
14 **undertake new coal-fired power plants because of concerns over increasing**  
15 **construction costs and/or the potential for federal regulation of greenhouse**  
16 **gas emissions?**

17 A, Yes. In just the past few months, a number of companies have announced that  
18 they will not pursue new coal-fired generating facilities. For example, in its  
19 Resource Plan filed in Colorado in November 2007, Xcel Energy concluded that:

20 In sum, in light of the now likely regulation of CO<sub>2</sub> emissions in  
21 the future due to a broader interest in climate change issues, the  
22 increased costs of constructing new coal facilities, and the  
23 increased risk of timely permitting to meet planned in-service  
24 dates, Public Service does not believe it would be prudent to  
25 consider at this time any proposals for new coal plants that do not  
26 include CO<sub>2</sub> capture and sequestration.<sup>11</sup>

---

<sup>11</sup> Public Service Company of Colorado, *2007 Colorado Resource Plan*, Volume 2 Technical Appendix, at page 2-34.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 In its recently filed 2007 Resource Plan in Minnesota, Xcel Energy similarly  
2 noted that “given the likelihood of future carbon regulation, we have only  
3 modeled a future coal-based resource option that includes carbon capture and  
4 storage.”<sup>12</sup> Xcel Energy also noted in its 2007 Minnesota Resource Plan that  
5 “Adding coal resources without sequestration would significantly add carbon and  
6 risk for our ratepayers.”<sup>13</sup>

7 Minnesota Power Company also has announced that it is considering only carbon  
8 minimizing resources and would not consider a new coal resource without a  
9 carbon solution.<sup>14</sup> The Company also said that in the long-term it would consider  
10 pulverized coal and IGCC plants but only with proven carbon capture and CO<sub>2</sub>  
11 sequestration technologies.<sup>15</sup>

12 Idaho Power Company similarly has concluded that:

13 Due to escalating construction costs, the transmission cost  
14 associated with a remotely located resource, potential permitting  
15 issues, and continued uncertainty surrounding GHG laws and  
16 regulations, IPC [Idaho Power Company] has determined that coal-  
17 fired generation is not the best technology to meet its resource  
18 needs in 2013. IPC has shifted its focus to the development of a  
19 natural gas-fired combined cycle combustion turbine located closer  
20 to its load center in southern Idaho.<sup>16</sup>

21 Avista Utilities also has announced that it will not pursue coal-fired power plants  
22 in the foreseeable future.

<sup>15</sup> *Id.*, at page 6.

<sup>16</sup> U.S. Securities and Exchange Commission Form 10-Q, Third Quarter of 2007, Idaho Power Company, at pages 49-50.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. Have any proposed coal-fired generating projects been cancelled or delayed**  
2 **as a result of concern over increasing construction costs or the potential for**  
3 **federal regulation of greenhouse gas emissions?**

4 A. Yes. According to published reports, approximately 20 coal-fired power plant  
5 projects have been cancelled or rejected by state regulatory commissions or  
6 boards in the past twelve months and more than three dozen others have been  
7 delayed, in part, because of concern over rising construction costs and climate  
8 change. For example:

9 **▪ Rocky Mountain Power, a division of PacifiCorp, has just cancelled two**  
10 **proposed coal plants. The Company explained the following in a**  
11 **November 28, 2007 letter to the Public Service Commission of Utah:**

12 Furthermore, due to the current uncertainty in the ability to  
13 quantify in any meaningful way the cost of compliance with  
14 potential federal CO2 legislation, Bridger 5 as a supercritical unit  
15 is no longer a viable option for 2014. Within the last few months, it  
16 has become apparent that Congress will enact some restriction  
17 upon carbon emissions, but the project cost impact upon new coal  
18 generation is currently within such a wide range as to make  
19 meaningful risk assessment futile. On November 13, 2007, the  
20 National Association of Regulatory Utility Commissioners adopted  
21 its first resolution acknowledging that climate change legislation  
22 addressing carbon emissions will occur. Within the last few  
23 months, most of the planned coal plants in the United States have  
24 been cancelled, denied permits, or been involved in protracted  
25 litigation. Accordingly, the Company submits that IPP 3, Bridger  
26 5, and the IGCC option at Jim Bridger are no longer viable options  
27 for [its] 2012 RFP for the 2012 and 2014 time frame, respectively.

28 **While the Company is not excluding new coal generation**  
29 **ownership from its 20 year options, absent some change in**  
30 **conditions, it cannot be determined at this time whether new**  
31 **coal generation will satisfy the least cost, least risk standards**  
32 **that would enable us to consider it as a viable option within**  
33 **our ten year plans. (Emphasis added)<sup>17</sup>**

---

<sup>17</sup> A copy of this letter is attached as Exhibit JI-35-B.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1           ▪       Xcel Energy announced in October 2007 that it was deferring indefinitely  
2           its plans to build an IGCC plant in Colorado because the development  
3           costs were higher than the utility originally expected.<sup>18</sup>

4           ▪       Tenaska Energy cancelled plans to build a coal-fired power plant in  
5           Oklahoma in July 2007 because of rising steel and construction prices.  
6           According to the Company’s general manager of business development:

7           “.. coal prices have gone up “dramatically” since Tenaska started  
8           planning the project more than a year ago.

9           And coal plants are largely built with steel, so there’s the cost of  
10          the unit that we would build has gone up a lot... At one point in  
11          our development, we had some of the steel and equipment at some  
12          very attractive prices and that equipment all of a sudden was not  
13          available.

14          We went immediately trying to buy additional equipment and the  
15          pricing was so high, we looked at the price of the power that would  
16          be produced because of those higher prices and equipment and it  
17          just wouldn’t be a prudent business decision to build it.”<sup>19</sup>

18          ▪       Westar Energy announced in December 2006 that it was deferring site  
19          selection for a new 600 MW coal-fired power plant due to significant  
20          increases in the facility’s estimated capital cost of 20 to 40 percent, over  
21          just 18 months. This prompted Westar’s Chief Executive to warn: “When  
22          equipment and construction cost estimates grow by \$200 million to \$400  
23          million in 18 months, it’s necessary to proceed with caution.”<sup>20</sup> As a  
24          result, Westar Energy has suspended site selection for the coal-plant and is  
25          considering other options, including building a natural gas plant, to meet  
26          growing electricity demand. The company also explained that:

27                   most major engineering firms and equipment manufacturers  
28                   of coal-fueled power plant equipment are at full production  
29                   capacity and yet are not indicating any plans to  
30                   significantly increase their production capability. As a  
31                   result, fewer manufacturers and suppliers are bidding on

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 new projects and equipment prices have escalated and  
2 become unpredictable.<sup>21</sup>

3 ■ TXU cancelled 8 of 11 proposed coal-fired power plants in the spring of  
4 2007 , in large part because of concern over global warming and the  
5 potential for federal legislation restricting greenhouse gas emissions.<sup>22</sup>

6 ■ Four public power agencies suspended permitting activities for the coal-  
7 fired Taylor Energy Center in the spring of 2007 because of growing  
8 concerns about greenhouse gas emissions.<sup>23</sup>

9 ■ Tampa Electric cancelled a proposed integrated gasification combined  
10 cycle plant (“IGCC”) in the fall of 2007 due to uncertainty related to CO<sub>2</sub>  
11 regulations, particularly capture and sequestration issues, and the potential  
12 for related project cost increases. According to a press release, “Because  
13 of the economic risk of these factors to customers and investors, Tampa  
14 Electric believes it should not proceed with an IGCC project at this time,”  
15 although it remains steadfast in its support of IGCC as a critical  
16 component of future fuel diversity in Florida and the nation.

17 ■ The Orlando Utilities Commission announced in November 2007 that it  
18 was the coal gasification portion of a 285-megawatt integrated gasification  
19 combined cycle (IGCC) facility at the Stanton Energy Center.  
20 Construction will continue on the natural gas-fired combined cycle  
21 generating unit. The Commission cited the impact of possible federal and  
22 state regulations related to future emissions restrictions in the state of  
23 Florida as the primary reason for terminating construction.<sup>24</sup>

24 ■ In June 2007, the Tondu Corp. announced that it was suspending plans to  
25 build a planned 600 MW IGCC facility in Texas citing high costs and  
26 other concerns related to technology and construction risks.<sup>25</sup>

27 **Q. Have you seen any instance where a participant in a jointly-owned coal-fired**  
28 **power plant project has withdrawn because of concern over increasing**  
29 **construction costs or the potential for future regulation of CO<sub>2</sub> emissions?**

30 A. Yes. GRE announced in September 2007 that it was withdrawing from the  
31 proposed Big Stone II Project. According to GRE, four factors contributed most

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 prominently to the decision to withdraw, including uncertainty about changes in  
2 environmental requirements and new technology and the fact that “The cost of  
3 Big Stone II has increased due to inflation and project delays.”<sup>26</sup> GRE also cited  
4 the new Minnesota legislation which established the dual goals of using  
5 renewable resources for 25 percent of its load by 2025 and achieving a 1.5  
6 reduction in annual energy sales through conservation measures.

7 **Q. Have any proposed coal-fired generating projects been rejected by state**  
8 **regulatory commissions due, in whole or in part, to concerns over increasing**  
9 **construction costs or the potential for federal regulation of greenhouse gas**  
10 **emissions?**

11 A. Yes. Although some new coal-fired power plant projects have been approved by  
12 state regulatory commissions and agencies during 2007, since last December  
13 proposed coal-fired power plant projects have been rejected by the Oregon Public  
14 Utility Commission, the Florida Public Service Commission, and the Oklahoma  
15 Corporation Commission. The North Carolina Utilities Commission rejected one  
16 of the two coal-fired plants proposed by Duke Energy Carolinas for its Cliffside  
17 Project. The Kansas Department of Health and Environment also has recently  
18 rejected proposed coal-fired power plants.

19 The decision of the Florida Public Service Commission in denying approval for  
20 the 1,960 MW Glades Power Project was based on concern over the uncertainties  
21 over plant costs, coal and natural gas prices, and future environmental costs,  
22 including carbon allowance costs.<sup>27</sup> In addition, the Oklahoma Corporation  
23 Commission voted in September of this year to reject Public Service of  
24 Oklahoma’s application to build a new coal-fired power plant.<sup>28</sup>

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 The Minnesota Public Utilities Commission also has refused to approve an  
2 agreement under which Xcel Energy would have purchased power from a  
3 proposed IGCC facility due to concerns over the uncertainties surrounding the  
4 plant’s estimated construction and operating costs and operating and financial  
5 risks.<sup>29</sup>

6 On October 18, 2007, the Kansas Department of Health and Environment rejected  
7 an application to build two 700 MW coal-fired units at an existing power plant  
8 site. In a prepared statement explaining the basis for this decision, Rod Bremby,  
9 Kansas’s secretary of health and environment noted that “I believe it would be  
10 irresponsible to ignore emerging information about the contribution of carbon  
11 dioxide and other greenhouse gases to climate change and the potential harm to  
12 our environment and health if we do nothing.”<sup>30</sup>

13 **Q. Is it important to evaluate the uncertainties and risks associated with**  
14 **alternatives to the Big Stone II Project as well?**

15 A. Yes. The risks associated with building natural gas-fired alternatives include  
16 potential CO<sub>2</sub> emissions costs, possible capital cost escalation and fuel price  
17 uncertainty and volatility.

18 Renewable alternatives and energy efficiency also have some uncertainties and  
19 risks. These include potential capital cost escalation, contract uncertainty and  
20 customer participation uncertainty.

21 Unfortunately, the Applicants have focused on the uncertainties and risks  
22 associated with the alternatives and have essentially ignored the significant  
23 uncertainties and risks associated with pursuing the Big Stone II Project.

1 **4. The Big Stone II Applicants Have Not Adequately Considered The**  
2 **Risks Associated With Future Federally Mandated Greenhouse Gas**  
3 **Reductions**

4 **Q. What mandatory greenhouse gas emissions reductions programs are**  
5 **currently under review in the U.S. federal government?**

6 A. To date, the U.S. government has not required greenhouse gas emission  
7 reductions. However, a number of legislative initiatives for mandatory emissions  
8 reduction proposals have been introduced in Congress. These proposals establish  
9 carbon dioxide emission trajectories below the projected business-as-usual  
10 emission trajectories, and they generally rely on market-based mechanisms (such  
11 as cap and trade programs) for achieving the targets. The proposals also include  
12 various provisions to spur technology innovation, as well as details pertaining to  
13 offsets, allowance allocation, restrictions on allowance prices and other issues.  
14 The federal proposals that would require greenhouse gas emission reductions that  
15 had been submitted in the current U.S. Congress are summarized in Table 1  
16 below.

 2 **Current US Congress**

3

4

5 The shaded area in Figure 3 above represents the 60% to 80% range of emission  
 6 reductions from current levels that leading scientists now believe will be  
 7 necessary to stabilize atmospheric CO<sub>2</sub> concentrations by the middle of this  
 8 century.

9 **Q. Are individual states also taking actions to reduce greenhouse gas emissions?**

10 A. Yes. A number of states are taking significant actions to reduce greenhouse gas  
 11 emissions, both individually and as part of regional efforts.

12 For example, Table 2 below lists the emission reduction goals that have been  
 13 adopted by states in the U.S. Regional action also has been taken in the  
 14 Northeast, Midwest and Western regions of the nation.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 A number of regional efforts to reduce greenhouse gas emissions also have been  
2 undertaken since I testified last December. For example, on February 26, 2007,  
3 the Governors of Arizona, California, New Mexico, Oregon and Washington  
4 announced the formation of the Western Regional Climate Action Initiative to  
5 implement a join strategy to reduce greenhouse gas emissions. The initiative is to  
6 include (1) developing a regional target for reducing greenhouse gases, (2)  
7 developing a market-based program such as a cap-and-trade system and (3)  
8 participating in a multi-state greenhouse gas registry.<sup>32</sup>

9 In addition, in November of this year, the Governors of the six Midwestern states,  
10 including Minnesota, Illinois, Iowa, Kansas, Michigan and Wisconsin, and the  
11 Premier of Manitoba signed the Midwestern Greenhouse Gas Accord. This  
12 agreement committed the states to establishing greenhouse gas emissions targets  
13 and timetables, to developing a market based and multi-sector cap-and-trade  
14 mechanism to achieve those reduction targets, to developing a regional registry  
15 and tracking mechanism, and to developing and implementing additional steps as  
16 needed to achieve the reduction targets.<sup>33</sup> The Governors of Indiana, Ohio and  
17 South Dakota also signed the agreement as observers to participate in the  
18 formation of a regional cap-and-trade system.

19 **Q. Have recent polls indicated that the American people are increasingly in**  
20 **favor of government action to address global warming concerns?**

21 A. Yes. Polls indicate an understanding by the public of the challenge of climate  
22 change and strong support in the U.S. for governmental response to the threat.

23 For example, a summer 2006 poll by Zogby International showed that an  
24 overwhelming majority of Americans are more convinced that global warming is  
25 happening than they were even two years ago. In addition, Americans also are

<sup>32</sup> "Five Western Governors Announce Regional Greenhouse Gas Reduction Agreement," press release dated February 26, 2007.

**Joint Intervenor Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 connecting intense weather events like Hurricane Katrina and heat waves to  
2 global warming.<sup>34</sup> Indeed, the poll found that 74% of all respondents, including  
3 87% of Democrats, 56% of Republicans and 82% of Independents, believe that  
4 we are experiencing the effects of global warming.

5 The poll also indicated that there is strong support for measures to require major  
6 industries to reduce their greenhouse gas emissions to improve the environment  
7 without harming the economy – 72% of likely voters agreed such measures  
8 should be taken.<sup>35</sup>

9 Other recent polls reported similar results. For example, a recent Stanford  
10 University/Associated Press poll found that 84 percent of Americans believe that  
11 global warming is occurring, with 52 percent expecting the world’s natural  
12 environment to be in worse shape in ten years than it is now.<sup>36</sup> Eighty-four  
13 percent of Americans wanted a great deal or a lot to be done to help the  
14 environment by President Bush, the Congress, American businesses and/or the  
15 American public. This represents ninety-two percent of Democrats and seventy-  
16 seven percent of Republicans.

17 At the same time, according to a 2006 public opinion survey for the  
18 Massachusetts Institute of Technology, Americans now rank climate change as  
19 the country’s most pressing environmental problem—a dramatic shift from three  
20 years ago, when they ranked climate change sixth out of 10 environmental  
21 concerns.<sup>37</sup> Almost three-quarters of the respondents felt the government should

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 do more to deal with global warming, and individuals were willing to spend their  
2 own money to help.

3 **Q. Have any of the Big Stone II Project Applicants assessed the potential impact**  
4 **of the climate change bills currently being considered in Congress on future**  
5 **CO<sub>2</sub> emissions allowance prices?**

6 A. MRES appears to be following developments concerning federal regulation of  
7 greenhouse gases. However, I have not seen any evidence that the Applicants  
8 have attempted to quantify what are likely ranges for future CO<sub>2</sub> emissions  
9 allowance prices.

10 **Q. What CO<sub>2</sub> prices have Otter Tail Power, MRES and CMMPA used in the**  
11 **supplemental modeling analyses of the Big Stone II Project that they have**  
12 **performed after GRE and SMMPA withdrew from the Project?**

13 A. Otter Tail Power, MRES and CMMPA each used a nominal \$9/ton CO<sub>2</sub> price in  
14 their new modeling analyses. This means that they assumed that the prices of CO<sub>2</sub>  
15 emissions allowances would not increase over time even with inflation. To the  
16 contrary, each of these Applicants has assumed that the real prices of CO<sub>2</sub>  
17 emissions allowances will decrease over time.

18 **Q. What CO<sub>2</sub> price has MDU used in its recent modeling analyses of the Big**  
19 **Stone II Project?**

20 A. MDU has not used any CO<sub>2</sub> price in its recent modeling analyses.

21 **Q. What was the basis for the \$9/ton CO<sub>2</sub> price used by OTP, MRES and**  
22 **CMMPA in their recent modeling analyses?**

23 A. The Applicants witnesses have said that the have used a \$9/ton based on a  
24 recommendation by the Department of Commerce concerning interim CO<sub>2</sub> prices  
25 to be used for resource planning until the Minnesota Commission adopts a final

**Joint Intervenors Exhibit JI-35**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 set of required CO<sub>2</sub> prices.<sup>38</sup> It is my understanding that this \$9/ton figure  
2 initially came from a 2003 settlement reached by Xcel Energy concerning the  
3 proposed Comanche power plant in Colorado.

4 **Q. Is the manner in which OTP, MRES and CMMPA have applied the \$9/ton**  
5 **CO<sub>2</sub> cost consistent with how Xcel Energy has used that price?**

6 A. No. Xcel Energy has escalated the \$9/ton price at the rate of inflation starting in  
7 the year 2010. As a result, the price remained constant in 2010 dollars. As I noted  
8 above, OTP, MRES and CMMPA have applied a \$9/ton cost starting in 2013 and  
9 have not increased that cost in line with inflation. Consequently, the CO<sub>2</sub> prices  
10 that were used in the past by Xcel Energy subsequent to the Comanche Settlement  
11 were substantially higher than the CO<sub>2</sub> prices now being used by OTP, MRES and  
12 CMMPA.

13 **Q. Does Xcel Energy now use the \$9/ton CO<sub>2</sub> price, escalated at the rate of**  
14 **inflation, in its resource planning?**

15 A. Xcel Energy now uses a range of CO<sub>2</sub> prices in its recent planning, with a mid  
16 case of \$20/ton starting in 2010 and escalating at 2.5 percent per year and high  
17 and low scenarios of \$9/ton and \$40/ton also starting in 2010 and escalating at the  
18 rate of inflation.<sup>39</sup>

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. Are the \$9/ton CO<sub>2</sub> price forecasts used by Otter Tail Power, MRES and**  
2 **CMPMA in their new modeling analyses of the Big Stone II Project**  
3 **reasonable in light of the uncertainty surrounding future CO<sub>2</sub> costs and the**  
4 **stringent reductions in CO<sub>2</sub> emissions that would be required under the**  
5 **global warming bills that have been introduced in the current U.S. Congress?**

6 A. No. As Xcel Energy indicates, a \$9/ton CO<sub>2</sub> price may be reasonable as the lower  
7 end of a broad range of CO<sub>2</sub> prices being considered in resource planning  
8 analyses. But it not reasonable as the highest CO<sub>2</sub> price to use when developing a  
9 least cost, least risk resource plan. Given all of the uncertainties surrounding  
10 future greenhouse gas regulations and costs, it is prudent to consider a broad  
11 range of CO<sub>2</sub> price forecasts in resource planning, not just a single price trajectory  
12 or the narrow range of prices between \$0/ton and \$9/ton.

13 Also, the \$9/ton CO<sub>2</sub> prices assumed by the Applicants in their new modeling  
14 analyses do not provide a significant economic incentive for the development and  
15 retrofitting of carbon capture and sequestration technologies on coal plants like  
16 Big Stone II because that price would be substantially below the currently  
17 estimated costs of carbon capture and sequestration.

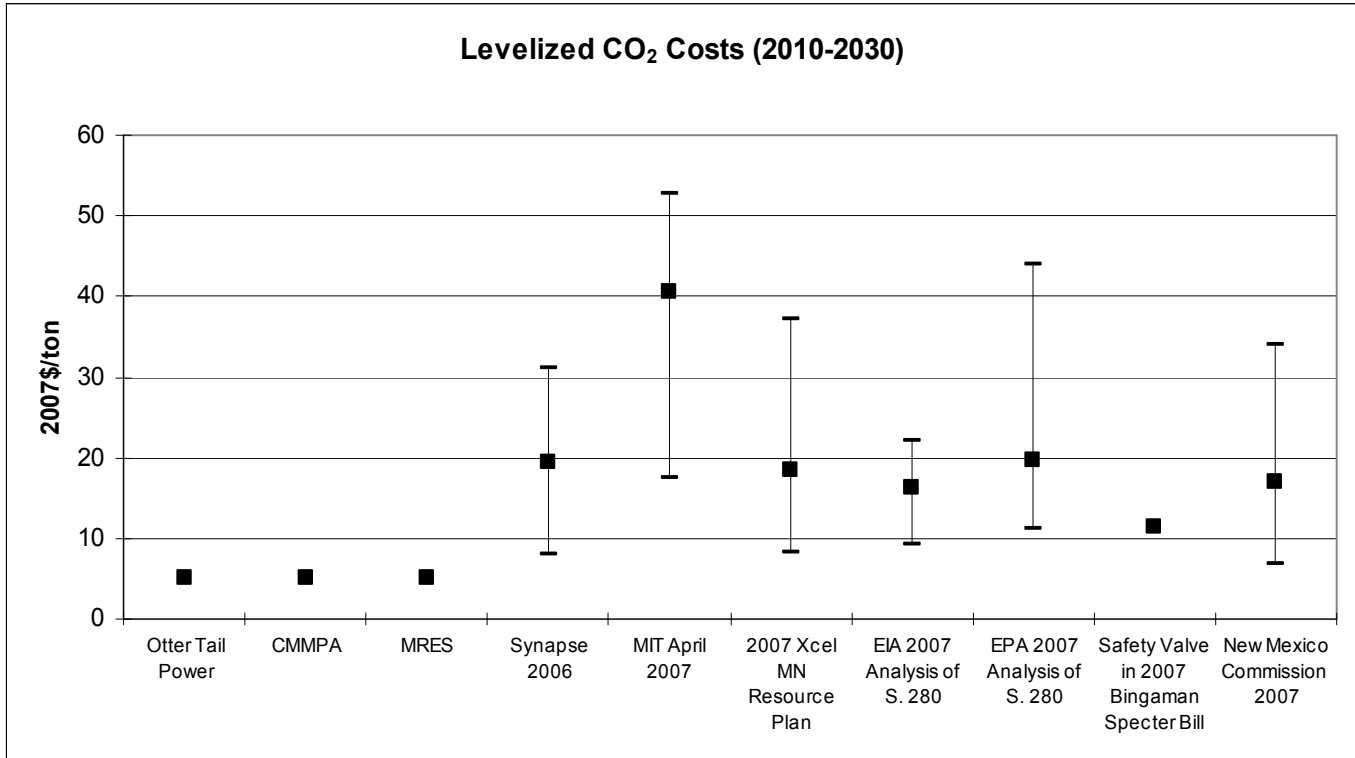

18 **Q. How do the CO<sub>2</sub> prices used by Otter Tail Power, CMPMA and MRES**  
19 **compare to the expected prices of CO<sub>2</sub> emissions allowances under the**  
20 **legislation currently being considered in the U.S. Congress?**

21 A. Figure 4 below compares the CO<sub>2</sub> prices used by OTP, MRES and CMPMA in  
22 their new modeling analyses to the projected prices of CO<sub>2</sub> emissions allowances  
23 developed in recent studies of the prices that would be needed to achieve the  
24 emissions reduction targets in global warming legislation that has been introduced  
25 in the current Congress. These studies include:

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1           **Figure 4:     The CO<sub>2</sub> Prices Used by OTP, MRES and CMMPA Compared**  
 2           **to the Expected Prices Under Legislation in the Current**  
 3           **Congress and the Synapse CO<sub>2</sub> Price Forecasts**

4  
 5           Figure 4 also includes the range of CO<sub>2</sub> prices that Xcel Energy has announced  
 6           that it will use for resource planning<sup>42</sup> and the range of CO<sub>2</sub> prices that the New  
 7           Mexico Public Regulation Commission has directed that utilities use in their  
 8           electric resource planning.<sup>43</sup> Finally, Figure 4 includes, on a levelized basis, the  
 9           Synapse forecasts of CO<sub>2</sub> prices that I presented in this proceeding in late 2006 in  
 10          Joint Intervenor Exhibits 1 and 3.<sup>44</sup>

11          Thus, on a levelized basis, the CO<sub>2</sub> prices used by OTP, MRES and CMMPA are  
 12          lower than even the lower ends of the ranges of CO<sub>2</sub> prices forecast by the EPA,

<sup>42</sup> Public Service Company of Colorado, *2007 Colorado Resource Plan*, Volume 2 Technical Appendix, at page 2-30.

<sup>43</sup> A copy of the New Mexico Commission’s June 2007 Order is included as Exhibit JI-35-E.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 EIA and MIT based on the legislative proposals in the current U.S. Congress and  
2 even the safety valve prices in Senate Bill S. 1766, the Bingaman-Specter global  
3 warming legislation. The CO<sub>2</sub> prices used by Otter Tail Power, CMMPA and  
4 MRES also are below the lower ends of the ranges of CO<sub>2</sub> prices recently adopted  
5 for resource planning by Xcel Energy and the New Mexico Public Regulation  
6 Commission.

7 In contrast, the Synapse CO<sub>2</sub> price forecasts are consistent with all of these CO<sub>2</sub>  
8 prices forecasts.

9 **Q. Why haven't you included the CO<sub>2</sub> prices that the Minnesota Commission**  
10 **recently adopted in Figure 4 above?**

11 A. The Minnesota Commission has adopted a range of CO<sub>2</sub> prices from \$4/ton to  
12 \$30/ton. However, the Commission has not yet issued an Order which indicates  
13 the rate of inflation that should be applied to those costs. As a result, I did not  
14 include those prices in Figure 4 above. Nevertheless, it is clear that the  
15 Commission's range of CO<sub>2</sub> prices would extend significantly above the \$9/ton  
16 cost assumed by OTP, MRES and CMMPA even if the costs remained flat in  
17 nominal terms and did not increase, even just at the rate of inflation.

18 **Q. Is it credible to assume, as MDU does, that CO<sub>2</sub> costs will be zero, that is,**  
19 **there will be no federal regulation of CO<sub>2</sub> emissions at any time during the**  
20 **expected 40 to 60 year operating life of the Big Stone II Project?**

21 A. No. Given the proposals being considered in Congress, public concern and  
22 scientific developments, it simply is not credible to project or assume that there  
23 will be no federal regulation of greenhouse gas emissions at any time over the  
24 next 40 to 60 years.

---

<sup>44</sup> A value that is "levelized" is the present value of the cost converted to equal annual payments. Costs are levelized in real dollars (i.e., adjusted to remove the impact of inflation).

**Joint Intervenor Exhibit JI-35**  
**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**  
**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**  
**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. How do the Synapse CO<sub>2</sub> price forecasts compare to the annual CO<sub>2</sub> prices**  
2 **used by OTP, CMMPA and MRES in their supplemental modeling analyses?**

3 A. The annual Synapse CO<sub>2</sub> price forecasts and the CO<sub>2</sub> prices used by Otter Tail  
4 Power, CMMPA and MRES, all in constant 2005 dollars, are shown in Figure 5  
5 below:

6 **Figure 5: Synapse and The Applicants' CO<sub>2</sub> Price Forecasts in Constant**  
7 **2005 Dollars**

8

9 **Q. Are the Synapse CO<sub>2</sub> price forecasts shown in Figure 5 based on any**  
10 **independent modeling?**

11 A. Yes. Although Synapse did not perform any new modeling to develop our CO<sub>2</sub>  
12 price forecasts, our CO<sub>2</sub> price forecasts were based on the results of independent  
13 modeling prepared at the Massachusetts Institute of Technology (“MIT”), the  
14 Energy Information Administration of the Department of Energy (“EIA”), Tellus,  
15 and the U.S. Environmental Protection Agency (“EPA”).<sup>45</sup>

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. What factors will affect the cost of CO<sub>2</sub> emissions allowances?**

2 A. Exhibit JI-1-F identified a number of factors that will affect projected allowance  
3 prices. These factors include: the base case emissions forecast; whether there are  
4 complementary policies such as aggressive investments in energy efficiency and  
5 renewable energy independent of the emissions allowance market; the policy  
6 implementation timeline; the reduction targets in a proposal; program flexibility  
7 involving the inclusion of offsets (perhaps international) and allowance banking;  
8 technological progress; and emissions co-benefits.<sup>46</sup> In particular, Synapse  
9 anticipates that technological innovation will temper allowance prices in the out  
10 years of our forecast.

11 **Q. Could carbon capture and sequestration be a technological innovation that**  
12 **might temper or even put a ceiling on CO<sub>2</sub> emissions allowance prices?**

13 A. Yes.

14 **Q. Do the Applicants believe that there is currently a commercially viable**  
15 **technology for carbon capture and sequestration from pulverized coal plants**  
16 **like the proposed Big Stone II Project?**

17 A. The Applicants provided the following answer when asked whether they believe  
18 that there currently is a commercially viable technology for post-combustion  
19 carbon capture and sequestration for pulverized coal power plants:

20 Currently a number of technologies exist or are in development for  
21 post combustion carbon capture. They range from the traditional  
22 amine absorber to membrane process to promising chilled  
23 ammonia, also to the development of enhanced amine processes.  
24 All of these technologies hold some degree of promise and  
25 opportunity. Only time will tell which ones will truly become  
26 commercially viable technology. By what we would consider  
27 today's standards, for the number of units in operation and cost, we  
28 would say there is no commercially viable technology in place

---

<sup>46</sup> Exhibit JI-1-F, at pages 46 to 49 of 63.

**Joint Intervenors Exhibit JI-35**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1                   today, but there are a number of very promising technologies under  
2                   development, as indicated by the list ... mentioned.<sup>47</sup>

3   **Q.    Is this a generally accepted view in the industry?**

4   A.    Yes. This conclusion is consistent with the general view in the electric industry.  
5           For example, a witness for Dominion Virginia Power presented testimony in July  
6           2007 that noted that:

7                   carbon capture technology is not commercially viable or available  
8                   at the present time. Furthermore, the successful integration of all of  
9                   the technologies needed for a commercial-scale carbon capture and  
10                  sequestration system has yet even to be demonstrated. As a result,  
11                  it is not currently feasible to construct a power plant with  
12                  technology that can capture and store carbon emissions.<sup>48</sup>

13           Even if such technology were available, retrofitting an existing coal plant with the  
14           technology for carbon capture and sequestration is expected to be very expensive,  
15           increasing the cost of generating power at the plant by perhaps as much as 68 to  
16           80 percent or higher.

17   **Q.    Have you seen any estimates for the cost of carbon capture and sequestration**  
18           **at proposed pulverized coal plants such as the Big Stone II Project?**

19   A.    Yes. Hope has been expressed concerning potential technological improvements  
20           and learning curve effects that might reduce the estimated cost of carbon capture  
21           and sequestration. However, I have seen recent studies by objective sources that  
22           estimate that the cost of carbon capture and sequestration could increase the cost  
23           of producing electricity at pulverized coal-fired power plants by 60-80 percent, on  
24           a \$/MWh basis.

25           For example, a very recent study by the National Energy Technology Laboratory  
26           ("NETL") has projected that the cost of carbon capture and sequestration would

<sup>47</sup> Applicants' Response to IR No. 292.a. A copy of this Response is included as Exhibit JI-35-F.

**Joint Intervenors Exhibit JI-35**  
**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**  
**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**  
**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 be about \$75/tonne<sup>49</sup> of CO<sub>2</sub> avoided, in 2007 dollars, for pulverized coal plants.<sup>50</sup>  
2 This would translate into about \$65/ton of CO<sub>2</sub> avoided, in 2005 dollars, a cost  
3 substantially above even the current Synapse High forecast.

4 The 2007 *Future of Coal Study* from the Massachusetts Institute of Technology  
5 estimated that the cost of carbon capture and sequestration would be about  
6 \$28/ton although it also acknowledged that there was uncertainty in that figure.<sup>51</sup>  
7 The tables in that study also indicated significantly higher costs for carbon capture  
8 for new pulverized coal facilities, in the range of about \$40/ton and higher.<sup>52</sup>  
9 Moreover, these costs were for new plants that were designed and built to include  
10 carbon capture technology at the outset. The MIT *Future of Coal Study* concluded  
11 that it would be much more expensive to retrofit carbon capture technology onto  
12 existing coal-fired power plants.<sup>53</sup> That means that the cost of retrofitting carbon  
13 capture technology onto plants that would already be built and in operation at the  
14 time that the technology becomes proven and commercially viable, like Big Stone  
15 II, could be significantly higher than the \$40/ton figure shown in the MIT Study  
16 for new coal plants.

17 Similarly, in a recent proceeding at the West Virginia Public Service  
18 Commission, Appalachian Power Company has estimated the costs of electricity  
19 from a number of coal-fired technologies with and without carbon capture and  
20 sequestration.<sup>54</sup> Appalachian Power estimates that the cost of just capturing the

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 CO<sub>2</sub> emissions from a new pulverized coal plant would be approximately \$43-  
2 \$46/MWh on a levelized basis.

3 I also have seen some preliminary estimates that some of the new technologies  
4 being examined may hold the promise of lowering carbon capture and  
5 sequestration costs to perhaps as low as \$20/ton of CO<sub>2</sub> avoided. However, those  
6 results are very preliminary and the associated technologies are untested.

7 Even when the technology for CO<sub>2</sub> capture matures, there will always be  
8 significant regional variations in the cost of the transportation and storage of the  
9 captured CO<sub>2</sub> due to the proximity and quality of storage sites.

10 **Q. Is there any consensus when carbon capture and sequestration technology**  
11 **will become commercially viable for pulverized coal plants like the Big Stone**  
12 **II Project?**

13 A. No. I have seen estimates that carbon capture and sequestration technology may  
14 be proven and commercially viable from as early as 2015 to 2030 or later, if,  
15 indeed, it is ever proven to be technically and commercially viable.

16 For example, the 2007 *Future of Coal* study from the Massachusetts Institute of  
17 Technology warned that:

18 Many years of development and demonstration will be required to  
19 prepare for its successful, large scale adoption in the U.S. and  
20 elsewhere. A rushed attempt at CCS [carbon capture and  
21 sequestration] implementation in the face of urgent climate  
22 concerns could lead to excess cost and heightened local  
23 environmental concerns, potentially lead to long delays in  
24 implementation of this important option.<sup>55</sup>

---

<sup>55</sup> *The Future of Coal, Options for a Carbon-Constrained World, an Interdisciplinary MIT Study*, 2007, at page 15.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. Have the Applicants provided any assessments of the potential or the**  
2 **feasibility of sequestering the CO<sub>2</sub> from the proposed Big Stone II Project?**

3 A. No. The have instead expressed faith that advances in technology in the future  
4 will enable the capture and sequestration of CO<sub>2</sub> emissions from Big Stone II at  
5 reasonable costs.<sup>56</sup>

6 **Q. Have the Applicants included any costs associated with carbon capture and**  
7 **sequestration in either the estimated Big Stone II Project construction cost or**  
8 **in their new modeling analyses?**

9 A. I am not aware of any significant costs for carbon capture and sequestration in the  
10 most recent, that is July 2006, Big Stone II Project construction cost estimate.  
11 There also is no evidence that the Applicants have included any costs associated  
12 with carbon capture and sequestration in their recent modeling analyses.

13 **Q. Do you believe that the Synapse CO<sub>2</sub> price forecasts remain valid despite**  
14 **being based, in part, on analyses from 2003-2005 which examined legislation**  
15 **that was proposed in past Congresses?**

16 A. Yes. Synapse believes it is important for the Minnesota PUC to rely on the most  
17 current information available about future CO<sub>2</sub> emission allowance prices, as long  
18 as that information is objective and credible. The analyses upon which Synapse  
19 relied when we developed our CO<sub>2</sub> price forecasts were the most recent analyses  
20 and technical information available when Synapse developed its CO<sub>2</sub> price  
21 forecasts in the Spring of 2006. However, new information shows that our CO<sub>2</sub>  
22 prices remain valid even though the original bills that comprised part of the basis  
23 for the forecasts expired at the end of the Congress in which they were  
24 introduced.

---

<sup>56</sup> For example, see the Applicants' Response to Joint Intervenors Information Request No. 292.(c), (d) and (e). Copies of these Responses are included in Exhibit JI-35-F.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 Many of the new greenhouse gas regulation bills that have been introduced in the  
2 current Congress would require much steeper reductions in greenhouse gas  
3 emissions than would have been required under the bills that had been introduced  
4 in Congress at the time we developed our Synapse CO<sub>2</sub> price forecasts. It is  
5 reasonable to expect that the increased stringency of current bills will lead to  
6 higher CO<sub>2</sub> emission allowance prices. Thus, if anything, our Synapse CO<sub>2</sub> price  
7 forecasts may be too low given the increased stringency of the current bills being  
8 considered in Congress. The higher forecast natural gas prices that are being  
9 forecast today, as compared to the natural gas price forecasts from 2003 or 2004,  
10 also can be expected to lead to higher CO<sub>2</sub> emissions allowance prices.

11 **Q. Would it be reasonable to assume that a new pulverized coal-fired plant like**  
12 **the Big Stone II Project will be grandfathered under federal climate change**  
13 **legislation or will be favored with the provision of extra CO<sub>2</sub> emission**  
14 **allowance allocations that could mitigate or offset the impact of CO<sub>2</sub>**  
15 **regulations?**

16 A. No. It is unclear what provisions for grandfathering existing coal plants (that is,  
17 allocating them allowances for free), if any, will be adopted as part of future  
18 greenhouse gas legislation. At the same time, it is unrealistic to expect that many  
19 or all of the new coal-fired plants currently being proposed will be grandfathered  
20 because of the substantial reductions in CO<sub>2</sub> emissions from current levels that  
21 have to be made by 2050 just to stabilize atmospheric concentrations of CO<sub>2</sub> at  
22 450 ppm to 550 ppm.

23 Meeting these goals will require either a reduction in dependence on coal for  
24 electricity generation or a very large investment in conversion of the current coal  
25 generating fleet in the U.S. The only realistic way either of these is going to  
26 happen is with a large marginal cost on greenhouse gas emissions such as a CO<sub>2</sub>  
27 tax or higher emissions allowance prices. It is not reasonable to expect that a new  
28 pulverized coal plant, like the Big Stone II Project, which will substantially

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 increase the emissions of CO<sub>2</sub> into the atmosphere, will receive significant  
2 emission allowances under any U.S. carbon regulation plan.

3 For example, the National Commission on Energy Policy<sup>57</sup> has recently  
4 recommended that “new coal plants built without [carbon capture and  
5 sequestration] not be “grandfathered” (i.e., awarded free allowances) in any future  
6 regulatory program to limit greenhouse gas emissions.”<sup>58</sup> A report of an  
7 interdisciplinary study at the Massachusetts Institute of Technology on *The*  
8 *Future of Coal* similarly noted that:

9 There is the possibility of a perverse incentive for increased early  
10 investment in coal-fired power plants without capture, whether  
11 SCPC or IGCC, in the expectation that the emissions from these  
12 plants would potentially be “grandfathered” by the grant of free  
13 CO<sub>2</sub> allowances as part of future carbon emissions regulations and  
14 that (in unregulated markets) they would also benefit from the  
15 increase in electricity prices that will accompany a carbon control  
16 regime. Congress should act to close this “grandfathering”  
17 loophole before it becomes a problem.<sup>59</sup>

18 Additionally, it has been proposed in Congress that new coal-fired plants would  
19 be required to actually have carbon capture and sequestration technology. For  
20 example, a bill by Massachusetts Senator Kerry would limit CO<sub>2</sub> emissions from  
21 new coal-fired facilities to 285 lbs/MWh.<sup>60</sup> New coal-fired facilities would be  
22 defined as those that begin construction on or after April 26, 2007 and would  
23 certainly include the proposed Big Stone II Project.

---

<sup>57</sup> The National Commission on Energy Policy is a bipartisan group of 20 energy experts from industry, government, academia, labor, consumer and environmental protection.

<sup>58</sup> *Energy Policy Recommendations to the President and the 110<sup>th</sup> Congress*, National Commission on Energy Policy, April 2007, at page 21.

<sup>59</sup> *The Future of Coal, Options for a Carbon-Constrained World, an Interdisciplinary MIT Study*, 2007, at page (xiv).

<sup>60</sup> This would be approximately 15 percent of Big Stone II’s projected emissions of roughly 1 ton per MWh.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. Is it possible that natural gas demand could be higher due to CO<sub>2</sub> emission**  
2 **regulations and, as a result, natural gas prices can be expected to be higher**  
3 **than otherwise would be the case?**

4 A. Yes. However, the effect is very complicated and will depend on a number of  
5 factors such as how much new natural gas capacity is built as a result of the  
6 higher coal-plant operating costs due to the CO<sub>2</sub> emission allowance prices, how  
7 much additional DSM and renewable alternatives become economic and are  
8 added to the U.S. system, the levels and prices of any incremental natural gas  
9 imports, and changes in the dispatching of the electric system. Thus it is very  
10 difficult to determine, at this time, the amount by which natural gas prices might  
11 be raised due to CO<sub>2</sub> emission regulations.

12 **Q. What are your recommendations concerning the CO<sub>2</sub> prices that the**  
13 **Minnesota PUC should use in evaluating the Applicants' proposed Big Stone**  
14 **II Project?**

15 A. I believe that unless the Minnesota Commission decides to use the range of CO<sub>2</sub>  
16 prices discussed at its December 6, 2007 session, it should use the Synapse  
17 forecasts of CO<sub>2</sub> prices to evaluate the relative economics of the proposed Big  
18 Stone II Project.

19 **Q. How much additional CO<sub>2</sub> would the Big Stone II Project emit into the**  
20 **atmosphere?**

21 A. A 500MW Big Stone II would emit approximately 3.7 million tons of CO<sub>2</sub>  
22 annually. A 580 MW Big Stone II would emit approximately 4.3 million tons of  
23 CO<sub>2</sub> each year.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. What would be the annual costs of greenhouse gas regulations to the**  
2 **Applicants and their customers under the Synapse CO<sub>2</sub> price forecasts if they**  
3 **proceed with the proposed Big Stone II Project?**

4 **A.** The annual expenditures on CO<sub>2</sub> emissions allowances that the participants in the  
5 Big Stone II Project and their customers would have to pay in 2015, 2020 and  
6 2030 under the Synapse low, mid and high price forecasts are shown in Table 3  
7 below for a 500 MW plant and in Table 4 below for a 580 MW plant:

8 **Table 3: 500 MW Plant Size - Annual Big Stone II Project Participant**  
9 **CO<sub>2</sub> Emissions Allowances Payments under Synapse Price**  
10 **Forecasts**

Year	Synapse Low CO <sub>2</sub> Price Forecast (Millions of Nominal \$)	Synapse Mid CO <sub>2</sub> Price Forecast (Millions of Nominal \$)	Synapse High CO <sub>2</sub> Price Forecast (Millions of Nominal \$)
2015	\$24	\$72	\$119
2020	\$54	\$135	\$216
2030	\$138	\$242	\$346

11  
12 **Table 4: 580 MW Plant Size - Annual Big Stone II Project Participant**  
13 **CO<sub>2</sub> Emissions Allowances Payments under Synapse Price**  
14 **Forecasts**

Year	Synapse Low CO <sub>2</sub> Price Forecast (Millions of Nominal \$)	Synapse Mid CO <sub>2</sub> Price Forecast (Millions of Nominal \$)	Synapse High CO <sub>2</sub> Price Forecast (Millions of Nominal \$)
2015	\$28	\$83	\$138
2020	\$63	\$157	\$251
2030	\$160	\$281	\$401

15  
16 **Q. What impact would assuming the Synapse range of CO<sub>2</sub> costs have on the**  
17 **total cost of power from the Big Stone II Project?**

18 **A.** The increases in the cost of power from the Big Stone II Project from using the  
19 Synapse range of CO<sub>2</sub> prices, on a levelized basis, are shown in Tables 5 and 6,  
20 below, for the Investor Owned and Public Power Owners of the Big Stone II

**Joint Intervenor Exhibit JI-35**  
**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**  
**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**  
**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 Project. The base costs, without CO<sub>2</sub> prices, are taken from the testimony of  
 2 Applicant witness Greig. These figures are for a 500 MW sized Big Stone II  
 3 Project. The percentage increases would be slightly higher for a 580 MW sized  
 4 plant.

5 **Table 5: Investor Owned Utilities – Increased Cost of Power from Big**  
 6 **Stone II Project Assuming Synapse CO<sub>2</sub> Price Forecasts**

	Big Stone II Project Levelized Cost (2013-2032)	Percentage Increase
	(\$/MWh)	
\$0/ton CO <sub>2</sub> Price	\$77.65	
Synapse Low CO <sub>2</sub> Price	\$88.13	13%
Synapse Mid CO <sub>2</sub> Price	\$101.27	30%
Synapse High CO <sub>2</sub> Price	\$138.03	47%

8 **Table 6: Public Power Utilities – Increased Cost of Power from Big**  
 9 **Stone II Project Assuming Synapse CO<sub>2</sub> Price Forecasts**

	Big Stone II Project Levelized Cost (2013-2032)	Percentage Increase
	(\$/MWh)	
\$0/ton CO <sub>2</sub> Price	\$61.38	
Synapse Low CO <sub>2</sub> Price	\$71.86	17%
Synapse Mid CO <sub>2</sub> Price	\$85.00	38%
Synapse High CO <sub>2</sub> Price	\$121.76	60%

11 **5. The Applicants Have Not Adequately Considered The Risk Of Further**  
 12 **Increases In The Estimated Capital Cost Of The Big Stone II Project**

13 **Q. What estimated capital costs for the Big Stone II Project have the Applicants**  
 14 **used in their recent modeling analyses?**

15 **A.** According to Applicant witness Rolfes, the currently estimated cost of a 500 MW  
 16 ultra supercritical Big Stone II Project is \$1.272 billion.<sup>61</sup> The currently estimated  
 17 cost for a 580 MW unit is \$1.411 billion.

---

1

2

**TRADE SECRET MATERIALS END].<sup>62</sup>**

3

**Q. Have you been able to fully evaluate the reasonableness of this cost estimate**

4

**and scheduled completion date?**

5

A. No. The Applicants refused to provide almost all of the detailed project

6

information, correspondence, and meeting minutes that the Joint Intervenors

7

requested in discovery.<sup>63</sup> This refusal has prevented us from determining whether

8

the Applicants are aware of any significant new developments regarding the

9

project's expected cost and schedule that they have sought to keep from the

10

Hearing Examiners and the Minnesota Commission. This is an important issue

11

because last year the Applicants had provided no information to the Commission

12

or the parties in this proceeding concerning the project suspension or hiatus that

13

began in early September 2006 until Joint Intervenors received project documents

14

just before the filing date for our November 29, 2006 testimony.

15

**Q. What is the current status of the Big Stone II Project?**

16

A. Although some work may have been undertaken, it appears that no major design

17

or procurement activities have been completed. Information that the Applicants

18

have provided to potential new Project participants indicates that they intend

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. Is it reasonable to expect that the estimated and/or ultimate cost of the**  
2 **project will be higher than the Applicants now estimate?**

3 A. Yes. The costs of building power plants have soared in recent years as a result of  
4 the worldwide demand for power plant design and construction resources and  
5 commodities. There is no reason to expect that plant costs will not continue to  
6 rise during the years when the detailed engineering, procurement and construction  
7 of the Big Stone II Project will be underway. This is especially true given the  
8 extremely early stage of the engineering and procurement for the project.

9 For example, Duke Energy Carolinas' originally estimated cost for the 1600 MW  
10 two unit coal-fired Cliffside Project was approximately \$2 billion. In the fall of  
11 2006, Duke announced that the cost of the project had increased by approximately  
12 47 percent (\$1 billion). After the project had been downsized because the North  
13 Carolina Utilities Commission refused to grant a permit for two units, Duke  
14 announced that the cost of that single unit would be about \$1.53 billion, not  
15 including financing costs. In late May 2007, Duke announced that the cost of  
16 building that single unit had increased by about another 20 percent. As a result,  
17 the estimated cost of the one unit that Duke is building at Cliffside is now \$1.8  
18 billion exclusive of financing costs. Thus, the single Cliffside unit is now  
19 expected to cost almost as much as Duke originally estimated for a two unit plant.

20 **Q. Did Duke explain to the North Carolina Utilities Commission the reasons for**  
21 **the skyrocketing cost of the Cliffside Project?**

22 A. Yes. In testimony filed at the North Carolina Utilities Commission on November  
23 29, 2006, Duke Energy Carolinas emphasized that the competition for resources  
24 had had a significant impact on the costs of building new power plants:

25 The costs of new power plants have escalated very rapidly. This  
26 effect appears to be broad based affecting many types of power  
27 plants to some degree. One key steel price index has doubled over  
28 the last twelve months alone. This reflects global trends as steel is  
29 traded internationally and there is international competition among

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 power plant suppliers. Higher steel and other input prices broadly  
2 affects power plant capital costs. A key driving force is a very  
3 large boom in U.S. demand for coal power plants which in turn has  
4 resulted from unexpectedly strong U.S. electricity demand growth  
5 and high natural gas prices. Most integrated U.S. utilities have  
6 decided to pursue coal power plants as a key component of their  
7 capacity expansion plan. In addition, many foreign companies are  
8 also expected to add large amounts of new coal power plant  
9 capacity. This global boom is straining supply. Since coal power  
10 plant equipment suppliers and bidders also supply other types of  
11 plants, there is a spill over effect to other types of electric  
12 generating plants such as combined cycle plants.<sup>68</sup>

13 Duke further noted that the actual coal power plant capital costs as reported by  
14 plants already under construction were exceeding government estimates of capital  
15 costs by “a wide margin (i.e., 35 to 40 percent).”<sup>69</sup> Additionally, according to  
16 Duke, currently announced power plants were appearing to face another  
17 approximate 40 percent increase in costs.” Thus, new coal-fired power plant  
18 capital costs had increased approximately 90 to 100 percent between 2002 and  
19 late 2006.

20 **Q. Have other coal-fired plant projects experienced similar cost increases?**

21 A. Yes. A large number of projects have announced significant construction cost  
22 increases over the past few years. For example:

- 23       ▪ The cost of Westar’s proposed coal-fired plant in Kansas, originally  
24 estimated at \$1 billion, increased by 20 percent to 40 percent, over just 18  
25 months.
- 26       ▪ Similarly, the estimated cost of the now-cancelled Taylor Energy Center  
27 in Florida increased by 25 percent, \$400 million, in just 17 months  
28 between November 2005 and March 2007.

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

- 1           ▪       The estimated cost of the Little Gypsy Repowering Project (gas to coal) in  
2                   Louisiana increased by 55 percent between announcement of the project in  
3                   April 2007 and the filing of a request for a license to build in July 2007.

4   **Q.    What are the sources of the worldwide competition for power plant design**  
5   **and construction resources, commodities and equipment?**

6   A.    The worldwide competition is driven mainly by huge demands for power plants in  
7           China and India, by a rapidly increasing demand for power plants and power plant  
8           pollution control modifications in the United States required to meet SO<sub>2</sub> and NO<sub>x</sub>  
9           emissions standards, and by the competition for resources from the petroleum  
10          refining industry. The demand for labor and resource to rebuild the Gulf Coast  
11          area after Hurricanes Katrina and Rita hit in 2005 also has contributed to rising  
12          costs for construction labor and materials. The anticipated construction of new  
13          nuclear power plants also is expected to compete for limited power plant design  
14          and construction resources, manufacturing capacity and commodities.

15 **Q.    Is it commonly accepted that domestic United States and worldwide**  
16 **competition for power plant design and construction resources, commodities**  
17 **and manufacturing have led to these significant increases in power plant**  
18 **construction costs in recent years?**

19 A.    Yes. The worldwide competition for power plant resources is generally  
20          recognized as the driving force for skyrocketing construction costs. For example,  
21          a June 2007 report by Standard & Poor's, *Increasing Construction Costs Could*  
22          *Hamper U.S. Utilities' Plan to Build New Power Generation*, found that:

23                   As a result of declining reserve margins in some U.S. regions ...  
24                   brought about by a sustained growth of the economy, the domestic  
25                   power industry is in the midst of an expansion. Standing in the way  
26                   are capital costs of new generation that have risen substantially  
27                   over the past three years. Cost pressures have been caused by  
28                   demands of global infrastructure expansion. In the domestic power  
29                   industry, cost pressures have arisen from higher demand for  
30                   pollution control equipment, expansion of the transmission grid,  
31                   and new generation. While the industry has experienced buildout

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 cycles in the past, what makes the current environment different is  
2 the supply-side resource challenges faced by the construction  
3 industry. A confluence of resource limitations have contributed,  
4 which Standard & Poors' Rating Services broadly classifies under  
5 the following categories

- 6 ■ Global demand for commodities
- 7 ■ Material and equipment supply
- 8 ■ Relative inexperience of new labor force, and
- 9 ■ Contractor availability

10 The power industry has seen capital costs for new generation climb  
11 by more than 50% in the past three years, with more than 70% of  
12 this increase resulting from engineering, procurement and  
13 construction (EPC) costs. Continuing demand, both domestic and  
14 international, for EPC services will likely keep costs at elevated  
15 levels.<sup>70</sup>

16 Standard & Poor's warned, therefore, that "it is possible that with declining  
17 reserve margins, utilities could end up building generation at a time when labor  
18 and materials shortages cause capital costs to rise, well north of \$2,500 per kW  
19 for supercritical coal plants and approaching \$1,000 per kW for combined-cycle  
20 gas turbines (CCGT)."<sup>71</sup>

21 Standard & Poor's also concluded that "as capital costs rise, energy efficiency and  
22 demand side management already important from a climate change perspective,  
23 become even more crucial as any reduction in demand will mean lower  
24 requirements for new capacity."<sup>72</sup>

25 Price increases have become so dramatic that the president of the Siemens Power  
26 Generation Group told the New York Times that "There's real sticker shock out

<sup>72</sup> id.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 there.”<sup>73</sup> He also estimated that in the last 18 months, the price of a coal-fired  
2 power plant has risen 25 to 30 percent. Similarly, in its 2007 Application to the  
3 Ohio Power Siting Board, American Municipal Power-Ohio noted that the price  
4 increases currently being experienced in the expected construction costs of coal  
5 based electric generation were “staggering.”<sup>74</sup>

6 Finally, a September 2007 report on *Rising Utility Construction Costs* prepared by  
7 the Brattle Group for the EDISON Foundation of the Edison Electric Institute  
8 similarly concluded that:

9 Construction costs for electric utility investments have risen  
10 sharply over the past several years, due to factors beyond the  
11 industry’s control. Increased prices for material and manufactured  
12 components, rising wages, and a tighter market for construction  
13 project management services have contributed to an across-the-  
14 board increase in the costs of investing in utility infrastructure.  
15 These higher costs show no immediate signs of abating.<sup>75</sup>

16 The report further found that:

- 17       ▪ Dramatically increased raw materials prices (e.g., steel, cement) have  
18 increased construction cost directly and indirectly through the higher cost  
19 of manufactured components common in utility infrastructure projects.  
20 These cost increases have primarily been due to high global demand for  
21 commodities and manufactured goods, higher production and  
22 transportation costs (in part owing to high fuel prices), and a weakening  
23 U.S. dollar.
- 24       ▪ Increased labor costs are a smaller contributor to increased utility  
25 construction costs, although that contribution may rise in the future as  
26 large construction projects across the country raise the demand for  
27 specialized and skilled labor over current or project supply. There also is a  
28 growing backlog of project contracts at large engineering, procurement  
29 and construction (EPC) firms, and construction management bids have

<sup>75</sup> *Rising Utility Construction Costs: Sources and Impacts*, prepared by The Brattle Group for the EDISON Foundation, September 2007, at page 31. A copy of this report is included as Exhibit JI-35-K.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1                    begun to rise as a result. Although it is not possible to quantify the impact  
2                    on future project bids by EPC, it is reasonable to assume that bids will  
3                    become less cost-competitive as new construction projects are added to the  
4                    queue.

5                    ■        The price increases experienced over the past several years have affected  
6                    all electric sector investment costs. In the generation sector, all  
7                    technologies have experienced substantial cost increases in the past three  
8                    years, from coal plants to windpower projects.... As a result of these cost  
9                    increases, the levelized capital cost component of baseload coal and  
10                   nuclear plants has risen by \$20/MWh or more – substantially narrowing  
11                   coal’s overall cost advantages over natural gas-fired combined-cycle  
12                   plants – and thus limiting some of the cost-reduction benefits expected  
13                   from expanding the solid-fuel fleet.

14                   ■        The rapid increases experienced in utility construction costs have raised  
15                   the price of recently completed infrastructure projects, but the impact has  
16                   been mitigated somewhat to the extent that construction or materials  
17                   acquisition preceded the most recent price increases. The impact of rising  
18                   costs has a more dramatic impact on the estimated cost of proposed utility  
19                   infrastructure projects, which fully incorporates recent price trends. This  
20                   has raised significant concerns that the next wave of utility investments  
21                   may be imperiled by the high cost environment. These rising construction  
22                   costs have also motivated utilities and regulators to more actively pursue  
23                   energy efficiency and demand response initiatives to reduce the future rate  
24                   impacts on consumers.<sup>76</sup>

25        **Q.        Is it reasonable to expect that the worldwide competition for power plant**  
26        **design and construction resources will continue to lead to further**  
27        **construction cost increases in future years?**

28        A.        Yes. I have seen no evidence that these long term factors will abate at any point  
29        in the foreseeable future. For example, a report by the consulting engineering firm  
30        of Burns and Roe for the City of Cleveland Division of Cleveland Public Power  
31        noted that it is difficult to predict the escalation of future power plant costs and  
32        expressed concern that “India is on the threshold of beginning a rapid expansion  
33        in the upcoming years will place additional pressure on the availability of raw

1 materials, shop fabrication space and available work force for engineering, site  
2 management staff and field labor and supervision.”<sup>77</sup>

3 **Q. Do the Applicants agree that these are the factors that have been driving the**  
4 **significant increases that have recently been experienced in the estimated**  
5 **costs of building new coal-fired power plants?**

6 A. Yes. In his testimony in this proceeding, Applicant witness Trout identified the  
7 following as among the factors that have led to increases in the costs of building  
8 new power plants:

9 Since the initial [Big Stone II cost] estimate was prepared in 2004,  
10 the power generation industry has experienced significant pricing  
11 increases for various commodities including steel, alloy piping,  
12 cable and wire, and other critical commodities. These have  
13 contributed to a constantly changing market for commodities and  
14 power plant equipment....

15 \* \* \* \*

16 • Major construction commodities have increased 30% to  
17 80% during the last two years.

18 • Labor rate escalation is currently double what it was two  
19 years ago.

20 The global demands (the governments of China and India, for  
21 example) for huge expansion in the electricity production sectors  
22 will impact equipment prices and creates raw material and  
23 fabrication facility (shop space) shortages worldwide for all types  
24 of energy production projects. The U.S. electricity production  
25 industry announced multiple large projects for development and  
26 construction, some of which have supply contracts which have  
27 recently been awarded. The energy and process markets are  
28 experiencing tremendous growth at the same time.

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

- 1                   •       Suppliers and Subcontractors that downsized after the  
2                               market collapsed in 2001 are challenged to grow their  
3                               capacity and workforce.
  
- 4                   •       Continuously increasing costs and longer delivery times for  
5                               raw materials are influencing engineered equipment costs  
6                               and commodity purchases.

7                   Increased costs for fuel have caused unexpected increases in  
8                               fabrication and transportation costs for delivery of fabricated  
9                               materials, as well as higher construction costs to build this  
10                              project.<sup>78</sup>

11                 In fact, Black & Veatch prepared a *Big Stone II Project Perspective Briefing Book*  
12                   *for Owners' CEOs – Supplemental materials*, in the spring of 2007 that indicated  
13                   the following concerning power plant construction costs and schedules:

<sup>82</sup> **TRADE SECRET MATERIALS END]**

**Q. Have the Applicants assumed any increases in the cost of building the Big Stone II Project as a result of the recent project hiatus or suspension and the result delay of more than one year?**

A. The Applicants have assumed that the cost of the Project will increase by the relative minor amount of 6 percent due to an additional year’s escalation of costs. However, they have not reflected any major cost increases due to the worldwide competition I have described above. In fact, the Applicants have assumed they will be able to *reduce* the estimated cost of the Project by about **[TRADE SECRET MATERIALS BEGIN TRADE SECRET MATERIALS END]**by achieving unspecified cost savings.<sup>83</sup> Although we have not had the opportunity to review the internal project documentation prepared since last November, it seems very unlikely that the Project will be able to avoid the significant delays and cost increases that numerous other projects have experienced in the past twelve months.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 IRP filed last month in Colorado, Xcel Energy noted that “Boiler unit costs are  
2 reported to have increased 50 to 80% in the last year.”<sup>87</sup>

3 **Q. In your opinion, is it prudent for the Applicants to ignore the potential for**  
4 **significant Big Stone II Project cost increases and schedule delays in their**  
5 **recent modeling and economic analyses?**

6 A. No. Although the current project cost estimate does include some contingencies,  
7 we believe that given the dramatic spike in coal plant construction costs over the  
8 last few years, it is reasonable to assume that the Project’s construction cost may  
9 be substantially higher than the Applicants now acknowledge and that the  
10 Project’s COD may be later than the Applicants now admit. This is especially  
11 true because all project contracts have not been let and many detailed design and  
12 all construction activities have not started. It is important to remember that the  
13 cost of this project already rose by more than 25 percent between 2004 and July  
14 2006.<sup>88</sup> Applicants have presented no evidence that the forces that caused that  
15 major price increase (and that are still causing “staggering” price increases around  
16 the nation) will not lead to further cost increases in the coming years.

17 In fact, even Applicant witnesses Rolfes and Trout have not foreclosed the  
18 potential for further increases in the Project’s estimated capital cost. For example,  
19 Mr. Trout has further noted that future changes in the estimated cost for the Big  
20 Stone II Project are “becoming more dependent on outside forces” some of which  
21 he describes in his October 2, 2006 Testimony.<sup>89</sup> He further noted that “the Big  
22 Stone II Co-owners have not been in a position realistically or reasonably to “lock  
23 in” the prices for a substantial portion of the major cost components of Big Stone

---

<sup>87</sup> Public Service Company of Colorado, *2007 Colorado Resource Plan*, Volume 2 Technical Appendix, at page 2-36.

<sup>88</sup> The estimated cost of the Project actually increased by significantly more than 25 percent in July 2006 but the Applicants offset much of that increase by assuming that substantial savings can be achieved in design and construction.

**Joint Intervenor Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 Unit II” and that “Until they do so, the project budget will be subject to further  
2 refinement.”<sup>90</sup>

3 **Q. Is it reasonable to expect that the Applicants could have updated their**  
4 **Project capital cost estimate at some point in the past year to reflect the**  
5 **industry-wide developments and cost trends you have described?**

6 A. Yes. It was not necessary for the Applicants to wait until next June or so to  
7 prepare a Big Stone II Project cost estimate and schedule update. Such  
8 information should have been prepared so that the Commission would have the  
9 most up-to-date information when it deliberates whether to grant a certificate for  
10 the proposed Project.

11 **Q. How should have the Applicants reflected the potential for further increases**  
12 **in the cost of the Big Stone II Project in their modeling analyses?**

13 A. In order to more fully evaluate the risks of continuing with the proposed project,  
14 the Applicants should have prepared sensitivity studies that examined the relative  
15 economics of the Big Stone II Project against alternatives assuming that the  
16 capital cost of the project is substantially higher than they now estimate and that  
17 the Project may not be in-service in June 2013.

18 For example, the Applicants could have prepared sensitivity analyses in their  
19 modeling analyses that reflected capital costs, 10, 20 percent and/or 40 percent  
20 higher than its current estimated cost for the Big Stone II Project. It is not  
21 unreasonable to expect such additional cost increases at the Project in light of the  
22 industry-wide experience and the expectation that worldwide demand will  
23 continue to be a driving force for rising prices.

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. Is it reasonable to expect that these same current market conditions also will**  
2 **lead to increases in the estimated costs of other supply-side alternatives such**  
3 **as natural gas-fired, wind or biomass facilities?**

4 A. Yes. However, it is not necessarily reasonable to expect that all of the alternative  
5 technologies will experience the same cost increases as a coal-fired project like  
6 Big Stone II. For example, even Otter Tail Power has assumed that natural gas-  
7 fired simple cycle and combined cycle plants will experience lower escalation  
8 than the Big Stone II Project.<sup>91</sup> Unfortunately, as I will discuss later, some of the  
9 Applicants have assumed that natural gas-fired power plants will experience  
10 larger cost increases than the Big Stone II Project. However, there is no evidence  
11 to support this assumption.

12 **Q. What impact would higher coal-plant capital costs have on the relative**  
13 **economics of energy efficiency as compared to the Big Stone II Project?**

14 A. I have seen no evidence that the same worldwide demand for power plant  
15 resources has led to significant increase in the costs of energy efficiency  
16 measures. Therefore, it is reasonable to expect that higher coal-plant capital costs  
17 increase the relative economics and attractiveness of energy efficiency.

1 **6. The Applicants' Recent Modeling Analyses Do Not Show that the Big**  
2 **Stone II Project is a Lower Cost Option than Energy Efficiency and/or**  
3 **Renewable Alternatives**

4 **6.A. Otter Tail Power**

5 **Q. How many modeling analyses does Otter Tail Power witness Morlock discuss**  
6 **in his Supplemental Testimony?<sup>92</sup>**

7 A. It is my understanding that Mr. Morlock's testimony and conclusions are based on  
8 just two model runs. In the first modeling run, Mr. Morlock determined what he  
9 considers to be "the optimized capacity expansion" plan without wholesale sales  
10 to the MISO spot market.<sup>93</sup> Mr. Morlock then reran the model, reflecting the same  
11 set of conditions, but with wholesale sales opportunities turned on. Other than  
12 that, both runs reflected all of the same assumptions about future costs and  
13 alternatives.

14 Most importantly, Mr. Morlock did not vary any other input assumptions other  
15 than turning the opportunity to make wholesale sales off and on. He did not  
16 examine the impact of higher CO<sub>2</sub> prices, higher Big Stone II Project construction  
17 costs, additional Project schedule delays, higher or lower fuel prices, higher or  
18 lower loads and energy requirements. He also did not compare the relative costs  
19 and benefits of alternate plans with or without the Big Stone II Project.

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. You testified in Joint Intervenors Exhibit 3 that the evidence presented by**  
2 **Otter Tail Power in support of its claim that Big Stone II was its least cost**  
3 **option is unpersuasive for a number of reasons.<sup>94</sup> Is this still your conclusion**  
4 **based upon your review of the modeling analysis discussed by Applicant**  
5 **witness Morlock?**

6 A. Yes. Otter Tail’s claim that the Big Stone II Project remains an essential  
7 component of its overall plan is unpersuasive for a significant number of reasons.

8 First, Mr. Morlock’s testimony and analysis really only show that the Big Stone II  
9 Project is a least-cost resource because it is picked as such by the IRP-Manager  
10 model, an out-of-date and severely limited model. Mr. Morlock provides  
11 absolutely no information on how much of an economic advantage Otter Tail’s  
12 preferred plan with Big Stone II produces over other plans that do not include the  
13 Big Stone II Project. Without this information, it is impossible to evaluate the  
14 potential economic benefits that might be produced by implementing the  
15 Company’s preferred plan against the risks associated with that plan or the  
16 benefits and risks of pursuing alternatives to the Big Stone II Project.

17 As I discussed at length last year in Exhibit JI-3, Otter Tail has acknowledged that  
18 the IRP-Manager model has significant limitations.<sup>95</sup> As I explained:

19 In summary, all of the limitations in the IRP-Manager model  
20 render it inadequate for use in determining whether the Big Stone  
21 II Project is the most economic option for the company’s  
22 ratepayers and for assessing the economic benefits of participating  
23 in that project against the risks of doing so. In fact, Otter Tail  
24 Power appears to be the only utility in the nation that uses this  
25 outdated planning model and it is even in the process of changing  
26 to a new planning model. The Minnesota Commission should not

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1                   rely on the results from the IRP-Manager model to find that  
2                   building the Big Stone II Project is reasonable.<sup>96</sup>

3                   When making such an important and far-reaching decision as whether to approve  
4                   Otter Tail Power’s participation in the proposed Big Stone II Project, the  
5                   Commission should not rely on two modeling runs from such an out-of-date and  
6                   limited model reflecting the very same set of assumptions about the future, with  
7                   the only difference being the potential to make wholesale sales. Instead, the  
8                   Commission should require Otter Tail to examine whether there are lower cost  
9                   energy efficiency and renewables alternatives than Big Stone II using state-of-the-  
10                  art capacity expansion and resource planning models such as the Strategist model  
11                  used by CMMPA, MRES and MDU.

12                  Second, Mr. Morlock did not examine whether the IRP-Manager model would  
13                  take additional energy efficiency resources above the amounts required by the  
14                  new Minnesota law.

15                  Third, Otter Tail has not prepared any sensitivity analyses to examine the impact  
16                  of changes in such key input assumptions as CO<sub>2</sub> prices, the cost of the Big Stone  
17                  II Project, the Project’s in-service date, fuel prices, coal supply disruptions, etc.  
18                  As I have shown in Sections 4 and 5 above, there is considerable uncertainty  
19                  regarding future CO<sub>2</sub> prices and the ultimate capital cost of the Big Stone II  
20                  Project. Mr. Morlock’s IRP-Manager modeling ignores all of this uncertainty and  
21                  only assumes that future CO<sub>2</sub> prices will be \$9/ton or less and that the final cost  
22                  of the Big Stone II Project will not be any higher than the Applicants’ current cost  
23                  estimate.

24                  Essentially, all that the modeling analysis discussed by Mr. Morlock shows is that  
25                  the IRP-Manager model selects the Big Stone II Project as part of a least cost plan  
26                  if the company’s assumptions about plant costs, schedule, CO<sub>2</sub> prices, fuel prices,

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 etc., are correct. There is no assessment of whether the Project would continue to  
2 be part of a least cost plan if key variables, such as CO<sub>2</sub> costs or plant capital costs  
3 vary, even in a modest way, from the company’s assumed values.

4 Fourth, Otter Tail has used only a very low CO<sub>2</sub> price, that is, \$9/ton in nominal  
5 terms, in its modeling analysis.<sup>97</sup>

6 Fifth, Mr. Morlock has artificially increased Otter Tail’s need for new capacity  
7 from the Big Stone II Project by assuming that the company’s required “planning  
8 reserve margin” will increase from [TRADE SECRET MATERIALS BEGIN

9

10 **TRADE SECRET MATERIALS END]**

11 Sixth Mr. Morlock incorrectly assumed [TRADE SECRET MATERIALS  
12 **BEGIN** **TRADE SECRET MATERIALS END]** in-service  
13 date for the Big Stone II Project. The Applicants’ testimony in this case is that the  
14 plant is currently scheduled to come on-line on June 1, 2013.<sup>98</sup>

15 Seventh, as Mr. Fagan discusses, in its new IRP-Manager analyses, Otter Tail  
16 Power has improperly represented its net energy for load in the out years.

17 Eighth, in his new modeling analysis, Mr. Morlock makes a number of revised  
18 assumptions that increase the cost of and, therefore, disadvantage the alternatives  
19 to the Big Stone II Project. For example, he has increased the cost of transmission  
20 for the non-wind alternatives, such as natural gas-fired plants, to \$250/kW. He  
21 also has made some adjustments that make the Manitoba Hydro alternative more  
22 expensive. At the same time that he adjusted upwards the costs of alternatives,  
23 Mr. Morlock used the Applicants’ currently estimated cost for the Big Stone II  
24 Project that includes a **TRADE SECRET MATERIALS BEGIN**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1                   **TRADE SECRET MATERIALS END]** due to unspecified savings in  
2                   the generation portion of the project.

3                   Given all of these biases, it really is no surprise that the IRP-Manager picked the  
4                   Big Stone II Project in the modeling analysis presented by Mr. Morlock.

5                   **Q.    You have mentioned that Otter Tail Power has used a \$9/ton CO<sub>2</sub> price. Is**  
6                   **that price in nominal or constant year dollars?**

7                   A.    The flat \$9/ton CO<sub>2</sub> price used by Otter Tail Power is in nominal dollars. This  
8                   means that it declines over time in real terms.

9                   **Q.    Is it realistic to assume that CO<sub>2</sub> prices will decline over time, in real terms?**

10                  A.    Absolutely not. I don't see any basis for assuming that CO<sub>2</sub> prices will decline  
11                  over time in real terms. Instead, as shown in Figure 5 above and Figure 6 below, it  
12                  is our Synapse assessment and the assessment of others, including Xcel Energy,  
13                  that CO<sub>2</sub> prices will increase over the long-term at or above the rate of inflation,  
14                  although there may be short run fluctuations up and down.

15                  **Q.    Is Otter Tail Power's use of a constant \$9/ton CO<sub>2</sub> price consistent with the**  
16                  **way that Xcel Energy has used a \$9/ton CO<sub>2</sub> price in resource planning?**

17                  A.    No. Until recently Xcel Energy used a \$9/ton CO<sub>2</sub> price that would begin in 2010  
18                  and increase at the rate of inflation. As shown in Figure 6, below, this results in a  
19                  higher set of annual CO<sub>2</sub> prices than have been used by Otter Tail Power in its  
20                  recent modeling analyses.

21                  Figure 6 also presents the CO<sub>2</sub> prices that Xcel Energy has recently announced  
22                  that it is currently using in its resource planning. As can be seen, these CO<sub>2</sub> prices  
23                  are significantly higher than the CO<sub>2</sub> price used by Otter Tail Power in its new  
24                  Big Stone II Project modeling analyses.

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1           **Figure 6:     Otter Tail and Xcel Energy CO<sub>2</sub> Price Forecasts**

2

3           Thus, both the 2003 Xcel and the 2007 Low Xcel CO<sub>2</sub> prices are higher than the  
4           CO<sub>2</sub> price used by Otter Tail in its recent Big Stone II Project modeling analyses.

5           **Q.     Applicant witness Uggerud has testified that “most regulators” do not**  
6           **“believe the CO<sub>2</sub> cost should be higher than \$9/ton.”<sup>99</sup> Was he able to provide**  
7           **any source documents or other written evidence which support this claim?**

8           **A.     No.** Otter Tail’s response to a request for such source documents and other  
9           materials was that:

10                     Mr. Uggerud responds that referenced testimony is supported by  
11                     his personal belief and conclusion, based on all materials he has  
12                     read, and on the materials others with whom Mr. Uggerud has  
13                     discussed the referenced topic have read, that as of the date of his  
14                     testimony “most regulators” did not believe CO<sub>2</sub> emissions costs

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**  
**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1                   on each ton of CO<sub>2</sub> emitted by an electric generating station should  
2                   exceed \$9/ton.<sup>100</sup>

3                   Mr. Uggerud was unable to provide even a single document that supports this  
4                   claim.

5   **Q.    Is Mr. Uggerud’s claim that “most regulators” do not believe the CO<sub>2</sub> cost**  
6   **should be higher than \$9/ton credible?**

7   A.    No. It is complete speculation unless he is able to cite to or provide any  
8           supporting evidence and documentation. Indeed, I have not seen any polls of  
9           regulators regarding what the costs of CO<sub>2</sub> emissions should be. Moreover, a  
10          number of states, including Oregon, New Mexico and California require their  
11          utilities to consider CO<sub>2</sub> prices higher than \$9/ton in their resource planning.

12 **Q.    Was Mr. Uggerud able to provide any evidence to support the judgment of**  
13 **Otter Tail Power that Congress will not impose a higher than \$9/ton carbon**  
14 **cost?**

15 A.    No. Instead, Mr. Uggerud gave only a limited narrative answer that provided no  
16          specific evidence to support his claim that Congress will not impose a higher than  
17          \$9/ton carbon cost.

18 **Q.    Is this judgment reasonable?**

19 A.    No. As I have shown in Figure 4 above, independent assessments by MIT, the  
20          EPA, and the EIA of the Department of Energy have shown that the legislation  
21          that has been introduced in the current Congress could lead to CO<sub>2</sub> emissions  
22          allowance prices far above \$9/ton. Earlier in this proceeding, the Applicants  
23          argued that the climate change proposal that was being circulated by Senator  
24          Bingaman was the most probable option. Even the safety valve CO<sub>2</sub> prices in the

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 Low Carbon Economy Act introduced by Senators Bingaman and Specter in July  
2 of 2007 would start at \$12/ton in 2012 and increase at five percent above the rate  
3 of inflation. Obviously, this would mean CO2 prices that would start above \$9/ton  
4 and climb far higher over time.

5 **Q. What planning reserve margins does Otter Tail Power use in its new IRP-**  
6 **Manager modeling analyses?**

7 A. The output files for the new modeling runs performed by Otter Tail Power  
8 suggest that the company has used the following planning reserve margins in its  
9 new modeling analyses.

10 **[TRADE SECRET MATERIALS BEGIN**

11

12

13 **TRADE SECRET MATERIALS END]**

14 The impact of the jump in the planning reserve margin in 2013 from **[TRADE**  
15 **SECRET MATERIALS BEGIN** **TRADE SECRET**  
16 **MATERIALS END]** would be to artificially inflate the amount of capacity that  
17 the model would add in that year, thereby increasing the amount of Big Stone II  
18 selected by the model.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. Have you rerun the IRP-Manager model to examine alternatives to the Big**  
2 **Stone II Project?**

3 A. No. Last year we considered attempting to rerun the IRP-Manager model but  
4 decided against doing so because of its limitations, the fact that the model is so  
5 slow, and because there is no continuing vendor support. We also concluded that  
6 we would not be able modify Otter Tail Power’s IRP-Manager database for use in  
7 the Strategist model in the five weeks we have had available to prepare this  
8 testimony.

9 **Q. Didn’t Otter Tail Power state last year that it was switching to the Strategist**  
10 **model for resource planning?**

11 A. Yes.

12 **Q. Has Otter Tail Power explained why it has not used the Strategist model to**  
13 **prepare its new Big Stone II Project related modeling analyses?**

14 A. Yes. Mr. Morlock has presented a litany of problems that he says delayed the  
15 transition to the Strategist model. Now the Company is aiming to use the  
16 Strategist model for its 2008 Resource Plan analyses.<sup>101</sup>

17 **Q. Is this reasonable?**

18 A. No. The decision to proceed with the Big Stone II Project is a major financial  
19 commitment for the Company and a major risk for its ratepayers. The most up-to-  
20 date resource planning model should be used to evaluate the costs and risks of the  
21 Big Stone II Project and the various alternatives. Strategist is a far more robust  
22 tool for evaluating resource alternatives. In contrast, the IRP-Manager model is an  
23 inadequate and out-dated tool for examining the full range of risks posed by the  
24 proposed Big Stone II Project.

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. What is your conclusion regarding Otter Tail Power’s recent modeling**  
2 **analyses?**

3 A. Otter Tail Power has not presented credible evidence that the Big Stone II Project  
4 is a lower cost and lower risk option than a portfolio of alternatives that would  
5 include energy efficiency, renewable resources and, to the extent necessary, some  
6 natural gas-fired capacity.

7 **6.B. CMMPA**

8 **Q. Has CMMPA shown that it needs any capacity from the Big Stone II Project**  
9 **in 2013 or subsequent years to ensure system reliability?**

10 A. No. Table 7 below presents CMMPA’s reserve margins with and without the Big  
11 Stone II Project for the years 2006-2035. These figures were taken directly from  
12 the output files of the Strategist modeling performed by CMMPA witness Davis.  
13 Thus, the results of CMMPA’s own modeling shows that it would not need any  
14 capacity from the Big Stone II Project to meet a 15 percent reserve margin until  
15 2033, at the earliest.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 such baseload energy because its new modeling analyses are flawed and biased in  
2 favor of the Project.

3 **Q. What flaws or biases have you identified in CMMPA’s new Big Stone II**  
4 **Project modeling analyses?**

5 A. We found the following flaws and biases in CMMPA’s new modeling of the Big  
6 Stone II Project:

- 7 ■ CMMPA did not allow the Strategist model to add capacity, including  
8 wind, prior to 2013 even though it might be more economic to do.
- 9 ■ As Mr. Fagan has discussed, CMMPA underestimated the effect of the  
10 1.5% CIP mandate and exaggerated the need for energy in the years  
11 beginning in 2020.
- 12 ■ CMMPA failed to model a reasonable range of future CO<sub>2</sub> prices.
- 13 ■ CMMPA failed to evaluate the impact of further increases in the  
14 construction cost and further delays in the completion of the Big Stone II  
15 Project.

16 **Q. Did you rerun the Strategist model to correct for these flaws and biases?**

17 A. Yes. We reran the model to (1) allow for the addition of capacity prior to 2013,  
18 (2) to examine a reasonable range of CO<sub>2</sub> prices, (3) to examine the consequences  
19 of further escalation in the cost of building the Big Stone II Project and (4) to  
20 correct for CMMPA’s underestimation of the 1.5% CIP mandate.

21 **Q. What were the results of your analyses?**

22 A. The results of our runs are presented in Table 8 below:

23 **Table 8: Synapse CMMPA Modeling Results – MWs of the Big Stone II**  
24 **Project selected by Strategist Model**

Scenario	Synapse CO <sub>2</sub> Price Scenario		
	Low	Mid	High
Base	21	10.5	0
BSII Capital Cost +10%	10.5	0	Did Not Run
CIP Correction	21	0	Did Not Run

25

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1           Thus, the Strategist model selected less Big Stone II Project capacity as part of its  
2           lowest cost plans when we used CMMPA’s base case assumptions but with our  
3           Synapse Low and Mid CO<sub>2</sub> price forecasts. The Strategist model selected none of  
4           Big Stone II with our Synapse High CO<sub>2</sub> price forecast.

5           Similarly, the Strategist model only chose 10.5 MW of the Big Stone II Project  
6           when we increased the capital cost of the Big Stone II Project by 10 percent and  
7           used the Synapse Low CO<sub>2</sub> price forecast. The model did not select any of the  
8           Big Stone II Project in its lowest cost plan when we increased the Project’s capital  
9           cost by 10 percent and used the Synapse Mid CO<sub>2</sub> price forecast. Given this  
10          result, we saw no reason to run the 10 percent higher Big Stone II capital cost  
11          with the Synapse High CO<sub>2</sub> price forecast. We also saw no need to examine the  
12          impact of larger increases in the Project’s construction cost because so little of the  
13          Project was selected with only a 10 percent increase, we expect that none of the  
14          Project’s capacity would be chosen if we assumed a 20 percent or higher capital  
15          cost increase.

16          Finally, the model chose just 21 MW of the Big Stone II Project when we  
17          corrected for the CIP underestimation error discussed by Mr. Fagan and the  
18          Synapse Low CO<sub>2</sub> price forecast. The model did not select any of the Big Stone  
19          II Project when we made the CIP correction and used the Synapse Mid CO<sub>2</sub> price  
20          forecast. Given this result, we saw no need to run the CIP correction with the  
21          Synapse High CO+ price forecast.

22          **Q.    What alternative capacity did the Strategist model add for CMMPA in those**  
23          **scenarios in which it did not select any of the Big Stone II Project?**

24          A.    Essentially the Strategist selected more wind and more gas-fired capacity in place  
25          of the Big Stone II Project. The specific alternative capacity selected in our  
26          modeling scenarios is shown in Table 9 below.

4 **6.C. MDU**

5 **Q. Have you identified any flaws or biases in the modeling analyses presented**  
6 **by MDU witness Heidell?**

7 **A.** Yes. MDU’s analyses are heavily biased in favor of the Big Stone II Project by  
8 the following:

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

- 1           ▪       MDU failed to reflect any CO<sub>2</sub> prices whatsoever, let alone look at a  
2                   reasonable range of possible CO<sub>2</sub> prices.
- 3           ▪       MDU failed to evaluate the impact of further increases in the construction  
4                   cost and further delays in the completion of the Big Stone II Project.
- 5           ▪       MDU made a number of assumptions that heavily bias the analysis against  
6                   natural gas-fired alternatives:
- 7                   •       MDU assumed that the operating life and book life for the Big  
8                   Stone II Project were set at 40 years while these inputs are set at  
9                   only 25 years for the natural gas-fired CC and CT options.
- 10                  •       MDU used a levelized charge rate for the CC and CT options of  
11                   11.54% (corresponding with the shorter book life) while the  
12                   levelized charge rate for the Big Stone II Project was 9.97%.
- 13                  •       The natural gas prices used by MDU in its modeling were  
14                   **[TRADE SECRET MATERIALS BEGIN**  
15                   **TRADE SECRET MATERIALS END]** than the natural gas  
16                   price forecasts used by Otter Tail Power, MRES, CMMPA, and in  
17                   the levelized cost analyses presented by Applicant witness Greig.  
18                   This was especially true in the years 2012 through approximately  
19                   2018.
- 20                  •       In its Base Case, MDU did not allow the model to choose a CC  
21                   after 2013.
- 22                  •       **[TRADE SECRET MATERIALS BEGIN**
- 23
- 24
- 25
- 26
- 27
- 28
- 29
- 30                                   **TRADE SECRET MATERIALS END]**
- 31           ▪       MDU did not allow the model to select increments of the Big Stone II  
32                   Project. Instead, the model is required to choose all 116 MW of MDU's  
33                   current share or none of the Project.

**Joint Intervenors Exhibit JI-35**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. Do you have any observations about the testimony of MDU witness Heidell**  
2 **that the resource plans with the Big Stone II Project are less expensive than**  
3 **the resource plans without the Project?**

4 A. Yes. MDU performed two sets of modeling analyses. One set for a 500 MW  
5 sized Big Stone II Project. A second for a 580 MW sized Project.

6 In MDU's base case modeling for the 500 MW sized Project, which reflected all  
7 of MDU's assumptions, the Strategist model included a full 116 MW share of the  
8 Big Stone II Project in its lowest cost plan. However, the lowest cost plan without  
9 the Big Stone II Project cost only \$12.3 million more, in 2006 dollars, and,  
10 therefore, was just 0.56 percent more expensive than the plan with the Big Stone  
11 II Project. Moreover, the lowest cost plan *without* the Big Stone II Project actually  
12 cost 5.6 percent less expensive than the plan with the Project during the planning  
13 period which runs through 2026.

14 This means that even with MDU's chosen assumptions, including no CO<sub>2</sub> costs,  
15 the plan with the 500 MW Big Stone II Project was more expensive during the  
16 Project's first thirteen years of operations, i.e., 2013-2026. The end effects  
17 modeled by Strategist overcame the poorer economics of the Big Stone II Project  
18 during these first thirteen years of operations.

19 Similarly, in the MDU Strategist model runs for a 580 MW sized Project, the  
20 lowest cost plan without Big Stone II Project was 4.40 percent less expensive than  
21 the lowest cost plan with the Project during the period through 2026. Again, the  
22 end effects modeled by Strategist overcame the poorer economics of the Big  
23 Stone II Project during its first thirteen years of operations.

24 In other words, in MDU's own base case runs, that is, with the 500 MW and 580  
25 MW sized Projects, Big Stone II was the more expensive option during the  
26 nearer-term period through 2026. It was only in the more distant, and more

1 uncertain future, that the Strategist model presented Big Stone II as a lower cost  
2 option.

3 **Q. Have you rerun MDU’s modeling analyses to reflect more reasonable**  
4 **assumptions?**

5 A. Yes. We have run a number of scenarios to see whether the Strategist model  
6 would include any of the Big Stone II Project if we included the Synapse CO<sub>2</sub>  
7 price forecasts or if we increased the Project’s current estimated cost by a minor  
8 amount, that is, ten percent.

9 **Q. What changes did you make to MDU’s assumptions when you reran the**  
10 **Strategist model?**

11 A. We modeled different CO<sub>2</sub> price scenarios: a \$9/ton price in 2013, increasing at  
12 the rate of inflation plus the Synapse Low CO<sub>2</sub> price forecast. We also ran  
13 scenarios in which the cost of building the Big Stone II Project was increased by  
14 10 percent. In addition, we ran scenarios in which we corrected for the  
15 unreasonably short operating and book lives that MDU had used for the combined  
16 cycle and combustion turbine alternatives. Finally, in one scenario we allowed the  
17 model the option to select the Big Stone II Project in 23.2 MW increments. Thus,  
18 the model was not constrained to select none or all of the Big Stone II Project.

19 **Q. What were the results of your analyses?**

20 A. The amount of Big Stone II Project capacity selected by the Strategist model in  
21 each of the scenarios we examined are shown in Table 10 below. The MDU base  
22 case results for the 500 MW and 580 MW Big Stone II Projects are included for  
23 comparison purposes:

**Joint Intervenors Exhibit JI-35**

2

**Table 10: Synapse MDU Modeling Results – MWs of the Big Stone II Project selected by Strategist Model**

Scenario	MW of Big Stone II Selected
MDU 500MW Base Case with \$0/ton CO <sub>2</sub> Price	116
MDU 500MW Base Case + \$9/ton CO <sub>2</sub> Price Escalated at 2.5% Per year	0
MDU 500MW Base Case + Synapse Low CO <sub>2</sub> Price	0
MDU 500MW Base Case + 10% Higher BSII Capital Cost	0
MDU 500MW Base Case + Corrected CC/CT Operating & Book Lives & LCR	0
MDU 580 MW Base Case with \$0/ton CO <sub>2</sub> Price	116
MDU 580MW Base Case + 10% Higher BSII Capital Cost	0
MDU 580MW Base Case + Synapse Low CO <sub>2</sub> Price + Corrected CC/CT Operating & Book Lives & LCR	0
MDU 580MW Base Case + Synapse Low CO <sub>2</sub> Price + Model Allowed to Select Big Stone II in 23 MW Increments	23

3

4

5

6

7

8

9

Thus, the Strategist model did not include any capacity from a 500 MW sized Big Stone II Project in its lowest cost plan when we assumed either (1) any CO<sub>2</sub> price of \$9/ton or higher, (2) 10 percent escalation in the current Big Stone II Project capital cost or (3) more reasonable operating and book lives for combined cycle and combustion turbine capacity that the assumptions used by MDU in its modeling analyses.

10

11

The Strategist model also did not include any capacity from a 580 MW sized Big Stone II Project when we (1) increased the Project's capital cost by 10 percent or

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 (2) corrected for the unreasonably short combined cycle and combustion turbine  
2 operating and book lives used by MDU. The model selected only 23 MW of the  
3 Big Stone II Project when we reran the Company's base case with our Synapse  
4 Low CO<sub>2</sub> prices and allowed the model to select capacity from the Project in 23  
5 MW increments.

6 **Q. In the scenarios where you increased the capital cost of the Big Stone II**  
7 **Project by 10 percent, did you also increase the capital costs of the**  
8 **alternatives by a comparable amount?**

9 A. No. As I noted earlier, MDU already had assumed extremely high capital costs for  
10 the combined cycle and combustion turbine alternatives. It was not necessary or  
11 appropriate to further increase the costs of these alternatives when we increased  
12 the cost of the Big Stone II Project. The costs for combined cycle and combustion  
13 turbine facilities assumed by MDU already accounted for any escalation above  
14 their reasonable values based on current market prices or the Black and Veatch  
15 projections.

16 **Q. What alternative capacity did the Strategist model add for MDU in those**  
17 **scenarios in which it did not select any of the Big Stone II Project?**

18 A. Essentially the Strategist selected more wind and more CT capacity in place of the  
19 Big Stone II Project. The specific alternative capacity selected in our modeling  
20 scenarios is shown in Table 11 below.

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **7. The analysis presented by Applicant Witness Greig Does Not Show**  
2 **that the Big Stone II Project is a Lower Cost Option than Energy**  
3 **Efficiency and/or Renewable Alternatives**

4 **Q. You testified in Joint Intervenors Exhibit 3 that the Commission should not**  
5 **rely on the analysis presented by Applicant witness Greig because that**  
6 **analysis is significantly flawed and biased in favor of the Big Stone II**  
7 **Project.<sup>103</sup> Is Mr. Greig’s new analysis similarly flawed and biased in favor**  
8 **of the Project?**

9 **A.** Yes. The analysis presented by Mr. Greig in Applicants Exhibits 121 and 121-A  
10 is biased in favor of the Big Stone II Project in the following ways:

- 11       ▪ Mr. Greig does not assume any low cost energy efficiency in his CCGT +  
12       Wind alternative, thereby ignoring the new Minnesota legislation that  
13       mandates energy efficiency savings of 1.5 percent per year.<sup>104</sup>  
14       Consequently, Mr. Greig’s levelized analysis does not show that the Big  
15       Stone II Project is a lower cost option than energy efficiency. Indeed, the  
16       addition of low cost energy efficiency would lower the cost of the CCGT  
17       + Wind option as compared to Big Stone II.
- 18       ▪ Mr. Greig only considered a very low and narrow range of future CO<sub>2</sub>  
19       prices, that is, from \$0/ton to \$9/ton. As I have demonstrated in Section 4  
20       above, this is significantly below a more reasonable range of CO<sub>2</sub> prices  
21       that should be used in resource planning.
- 22       ▪ Contrary to the assumptions used by his clients in their modeling analyses,  
23       Mr. Greig assumes no capacity credit for wind. He therefore overbuilds  
24       the amount of natural gas capacity. This leads him to unreasonably inflate  
25       the levelized cost of the CCGT + Wind alternative because it requires  
26       building more CCGT capacity.
- 27       ▪ Mr. Greig does not prepare any sensitivity analyses to reflect the risk that  
28       the Project’s ultimate cost may be significantly higher.
- 29       ▪ Mr. Greig assumes that the two investor-owned utility Applicants would  
30       finance their investments in the Big Stone II Project and the CCGT +  
31       Wind alternatives with a capital structure that is 50 percent equity and 50  
32       debt. **[TRADE SECRET MATERIALS BEGIN**

<sup>106</sup> **TRADE SECRET MATERIALS END]**

Equity has a higher cost than debt (12% vs. 7.5% in Mr. Greig’s analysis). Consequently, Mr. Greig’s use of a 50/50 capital structure instead of the actual Otter Tail and MDU capital structures, causes him to understate the cost of financing both Big Stone II and the CCGT + Wind option. However, the effect is much more significant for Big Stone II which has a far higher construction cost that would need to be financed than the CCGT + Wind option. This biases the results of his analysis in favor of Big Stone II because his capital costs do not reflect the full costs of financing.

- Mr. Greig’s scenarios that assume that the wind production tax credit will not be available in 2013 are unrealistic and contrary to the assumptions of his clients in their recent Big Stone II Project modeling.

**Q. What wind capacity credits do the Big Stone II Project Applicants assume in their recent modeling studies?**

A. CMMPA assumes a **[TRADE SECRET MATERIALS BEGIN TRADE SECRET MATERIALS END]** percent capacity credit for wind. MRES assumes a **[TRADE SECRET MATERIALS BEGIN TRADE SECRET MATERIALS END]** percent capacity credit for wind. MDU assumes a **[TRADE SECRET MATERIALS BEGIN TRADE SECRET MATERIALS END]** percent capacity credit for wind.

<sup>106</sup> Id., at Bates Page Number OTP0008605.

**Joint Intervenors Exhibit JI-35**  
**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**  
**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**  
**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. What impact would assuming a capacity credit for wind have on the results**  
2 **of Mr. Greig’s analysis?**

3 A. Assuming a capacity credit for wind would mean that less combined cycle  
4 capacity would need to be built in the CCGT + Wind alternative. This should lead  
5 to a lower levelized cost.

6 **Q. Have any of the Applicants assumed that the wind Production Tax Credit**  
7 **will remain in effect through 2013?**

8 A. Yes. Mr. Morlock has testified that Otter Tail Power has assumed in its recent  
9 modeling that the Federal Production Tax Credit would be renewed for five years  
10 through 2013 but then not be available that point.<sup>107</sup>

11 **Q. Is this a reasonable assumption?**

12 A. I agree that it is reasonable to assume that the wind Production Tax Credit will be  
13 renewed through 2013. The prospects for the Credit after that point are uncertain.  
14 However, it has been renewed on a number of occasions and may again be  
15 renewed by the Congress in or before 2013. In any event, I agree with Mr.  
16 Morlock that the Production Tax Credit will be in effect through at least 2013. For  
17 this reason, Mr. Greig’s scenarios that assume no PTC should be given little or no  
18 weight.

19 **Q. Have you seen how any other investor owned utilities that provide service in**  
20 **Minnesota have addressed the potential extension of the wind Production**  
21 **Tax Credit?**

22 A. Yes. In its recently filed 2007 Resource Plan filing, Xcel Energy has assumed that  
23 the Production Tax Credit will be extended through 2015.<sup>108</sup>

<sup>107</sup> Applicants’ Exhibit 116, at page 9, lines 1-7.  
<sup>108</sup> At page 4-4.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Q. Have you requested information from Otter Tail Power and MDU regarding**  
2 **their current and projected capital structures and costs of equity and debt?**

3 A. Yes. We wanted to see how Mr. Greig’s results would change if his analysis  
4 reflected both Otter Tail and MDU current actual capital structures and plans for  
5 the future instead of just a 50/50 mix of equity and debt. Unfortunately, the  
6 Applicants objected to providing this information.<sup>109</sup> The Judges have now  
7 directed the Applicants to provide this information but they have not yet done so.  
8 Therefore, we have been unable thus far to evaluate the significance of changing  
9 Mr. Greig’s analysis to reflect more realistic assumptions.

10 **Q. Have you recalculated Mr. Greig’s analysis to correct for each of the flaws**  
11 **that you have identified above?**

12 A. No. Due to the extremely accelerated schedule in this proceeding and lack of  
13 information produced in discovery we have only had the chance to correct Mr.  
14 Greig’s analysis to reflect the set of Synapse CO<sub>2</sub> price forecasts.

15 **Q. What were the results of your recalculation of Mr. Greig’s levelized analysis**  
16 **using the Synapse CO<sub>2</sub> price forecasts?**

17 A. The results of our recalculation of Mr. Greig’s analysis changing only the  
18 assumed CO<sub>2</sub> prices from the \$0/ton and \$9/ton figures used by Mr. Greig to the  
19 Synapse Low, Mid and High price forecasts are shown in Tables 12, 13, and 14  
20 below.

---

<sup>109</sup> For example, see the Applicants’ Responses to Joint Intervenors’ Information Requests Nos. 282 through 287. Copies of these Responses are included in Exhibit JI-35-R.

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 **Table 12: Greig Analysis with Synapse Low CO<sub>2</sub> Price Forecast**

		500 MW	580 MW
	CCGT + Wind	Big Stone II	Big Stone II
	(\$/MWh)	(\$/MWh)	(\$/MWh)
Greig Gas Cost - \$1.00/MMBTU	\$85.53	\$87.72	\$85.36
Greig Gas Cost - \$0.50/MMBTU	\$87.16	\$87.72	\$85.36
Greig Base Gas Cost	\$88.94	\$87.72	\$85.36
Greig Gas Cost + \$0.50/MMBTU	\$91.05	\$87.72	\$85.36
Greig Gas Cost + \$1.00/MMBTU	\$93.46	\$87.72	\$85.36

3 **Table 13: Greig Analysis with Synapse Mid CO<sub>2</sub> Price Forecast**

		500 MW	580 MW
	CCGT + Wind	Big Stone II	Big Stone II
	(\$/MWh)	(\$/MWh)	(\$/MWh)
Greig Gas Cost - \$1.00/MMBTU	\$88.43	\$103.27	\$101.07
Greig Gas Cost - \$0.50/MMBTU	\$90.37	\$103.27	\$101.07
Greig Base Gas Cost	\$92.77	\$103.27	\$101.07
Greig Gas Cost + \$0.50/MMBTU	\$95.22	\$103.27	\$101.07
Greig Gas Cost + \$1.00/MMBTU	\$97.72	\$103.27	\$101.07

5 **Table 14: Greig Analysis with Synapse High CO<sub>2</sub> Price Forecast**

		500 MW	580 MW
	CCGT + Wind	Big Stone II	Big Stone II
	(\$/MWh)	(\$/MWh)	(\$/MWh)
Greig Gas Cost - \$1.00/MMBTU	\$92.08	\$120.00	\$117.90
Greig Gas Cost - \$0.50/MMBTU	\$94.50	\$120.00	\$117.90
Greig Base Gas Cost	\$97.00	\$120.00	\$117.90
Greig Gas Cost + \$0.50/MMBTU	\$99.50	\$120.00	\$117.90
Greig Gas Cost + \$1.00/MMBTU	\$102.00	\$120.00	\$117.90

7 Thus, changing only the CO<sub>2</sub> prices makes both the 500 MW and the 580 MW  
8 sized Big Stone II Project options significantly more expensive than the CCGT +  
9 Wind alternative in each of the natural gas price scenarios with the Synapse Mid  
10 and High CO<sub>2</sub> price forecasts. With the Synapse Low CO<sub>2</sub> price Forecast, the  
11 CCGT + Wind and 500 MW Big Stone II Project are close in price with low  
12 natural gas prices; the 500 MW Big Stone II Project has a slightly lower levelized  
13 cost with higher natural gas prices. Finally, with the Synapse Low CO<sub>2</sub> price  
14 Forecast, the 580 MW has a lower cost than the CCGT + Wind option except that

**Joint Intervenors Exhibit JI-35**

**Cases OAH No. 12-2500-17037-2, MPUC Dkt No. CN-05-619 and**

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 the levelized cost of the 580 MW coal and CCGT + Wind alternatives narrows  
2 with lower natural gas prices .

3 **Q. Why have you included the Greig Gas Cost - \$0.50/MMBTU and Greig Gas**  
4 **Cost - \$1.00/MMBTU natural gas prices in your recalculation of Mr. Greig’s**  
5 **levelized analysis?**

6 A. I included the two lower natural gas prices in my recalculation of Mr. Greig’s  
7 levelized analysis to reflect the great uncertainty surrounding future natural gas  
8 prices. Mr. Greig talks about the uncertainty surrounding natural gas prices, but  
9 only examines sensitivities that reflect higher natural gas prices than he assumes  
10 in his base case. I have included the two lower natural gas price forecasts to  
11 reflect the possibility that natural gas prices will be lower than Mr. Greig now  
12 projects in his base case. In fact, as shown in Figure 8 above, the gas prices used  
13 by OTP, CMMPA and MRES in their new modeling analyses are [TRADE  
14 **SECRET MATERIALS BEGIN TRADE SECRET MATERIALS**  
15 **END]** than those used by Mr. Greig.

16 **Q. What do you think would be the impact of correcting for the other flaws you**  
17 **have found in Mr. Greig’s analysis?**

18 A. Assuming some low cost energy efficiency, a reasonable capacity credit for wind,  
19 further increases in the cost of the Big Stone II Project, and more realistic capital  
20 structures for Otter Tail Power and MDU almost certainly would improve the  
21 relative economics of the CCGT + Wind alternative compared to the Big Stone II  
22 Project.

23 **Q. Have you revised Mr. Greig’s analysis for the public power participants in**  
24 **the Project?**

25 A. No. Early last week we discovered a flaw in Mr. Greig’s Excel file workbooks for  
26 the public power entities that prevented us from affecting the ultimate levelized  
27 prices by changing the CO<sub>2</sub> costs. We asked for an opportunity to talk with Mr.

**OAH No. 12-2500-17038-2, MPUC Dkt. No. TR-05-1275**

**Supplemental Testimony of David A. Schlissel**

**PUBLIC VERSION –TRADE SECRET INFORMATION REDACTED**

1 Greig to discuss this problem. However, the Applicants did not respond to this  
2 request until Tuesday, December 18<sup>th</sup>. Unfortunately, it is now too late to address  
3 this issue before we must file my testimony.

4 **Q. What is your overall conclusion regarding the levelized price analysis**  
5 **presented by Applicant witness Greig?**

6 A. The Commission should not rely on Mr. Greig’s levelized price forecast as  
7 evidence that the Big Stone II Project will be a lower cost option for Otter Tail  
8 Power and MDU than wind or energy efficiency in combination with some  
9 natural gas-fired combined cycle capacity.

10 **Q. Does this complete your testimony?**

11 A. Yes.
